Abstract

This Recommendation specifies an abstract modularization of XHTML and an implementation of the abstraction using XML Document Type Definitions (DTDs). This modularization provides a means for subsetting and extending XHTML, a feature needed for extending XHTML's reach onto emerging platforms.

Status of This Document

This section describes the status of this document at the time of its publication. Other documents may supersede this document. The latest status of this document series is maintained at the W3C.

This document has been reviewed by W3C Members and other interested parties and has been endorsed by the Director as a W3C Recommendation. It is a stable document and may be used as reference material or cited as a normative reference from another document. W3C's role in making the Recommendation is to draw attention to the specification and to promote its

widespread deployment. This enhances the functionality and interoperability of the Web.

This document has been produced by the W3C HTML Working Group (*members only*) as part of the W3C HTML Activity. The goals of the HTML Working Group are discussed in the HTML Working Group charter. The W3C staff contact for work on HTML is Masayasu Ishikawa.

Public discussion of HTML takes place on www-html@w3.org (archive). To subscribe send an email to www-html-request@w3.org with the word *subscribe* in the subject line.

Please report errors in this document to www-html-editor@w3.org (archive). The list of known errors in this specification is available at <http://www.w3.org/2001/04/REC-xhtml-modularization-20010410-errata>.

The English version of this specification is the only normative version. Information about translations of this document is available at <http://www.w3.org/MarkUp/translations>.

A list of current W3C Recommendations and other technical documents can be found at <http://www.w3.org/TR>.

1. Introduction

This section is *informative*.

1.1. What is XHTML?

XHTML is the reformulation of HTML 4 as an application of XML. XHTML 1.0 [XHTML1] [p.170] specifies three XML document types that correspond to the three HTML 4 DTDs: Strict, Transitional, and Frameset. XHTML 1.0 is the basis for a family of document types that subset and extend HTML.

1.2. What is XHTML Modularization?

XHTML Modularization is a decomposition of XHTML 1.0, and by reference HTML 4, into a collection of abstract modules that provide specific types of functionality. These abstract modules are implemented in this specification using the XML Document Type Definition language, but an implementation using XML Schemas is expected. The rules for defining the abstract modules, and for implementing them using XML DTDs, are also defined in this document.

These modules may be combined with each other and with other modules to create XHTML subset and extension document types that qualify as members of the XHTML-family of document types.

1.3. Why Modularize XHTML?

The modularization of XHTML refers to the task of specifying well-defined sets of XHTML elements that can be combined and extended by document authors, document type architects, other XML standards specifications, and application and product designers to make it economically feasible for content developers to deliver content on a greater number and diversity of platforms.

Over the last couple of years, many specialized markets have begun looking to HTML as a content language. There is a great movement toward using HTML across increasingly diverse computing platforms. Currently there is activity to move HTML onto mobile devices (hand held computers, portable phones, etc.), television devices (digital televisions, TV-based Web browsers, etc.), and appliances (fixed function devices). Each of these devices has different requirements and constraints.

Modularizing XHTML provides a means for product designers to specify which elements are supported by a device using standard building blocks and standard methods for specifying which building blocks are used. These modules serve as "points of conformance" for the content community. The content community can now target the installed base that supports a certain collection of modules, rather than worry about the installed base that supports this or that permutation of XHTML elements. The use of standards is critical for modularized XHTML to be

successful on a large scale. It is not economically feasible for content developers to tailor content to each and every permutation of XHTML elements. By specifying a standard, either software processes can autonomously tailor content to a device, or the device can automatically load the software required to process a module.

Modularization also allows for the extension of XHTML's layout and presentation capabilities, using the extensibility of XML, without breaking the XHTML standard. This development path provides a stable, useful, and implementable framework for content developers and publishers to manage the rapid pace of technological change on the Web.

1.3.1. Abstract modules

An XHTML document type is defined as a set of abstract modules. A abstract module defines one kind of data that is semantically different from all others. Abstract modules can be combined into document types without a deep understanding of the underlying schemas that define the modules.

1.3.2. Module implementations

A module implementation consists of a set of element types, a set of attribute-list declarations, and a set of content model declarations, where any of these three sets may be empty. An attribute-list declaration in a module may modify an element type outside the element types defined in the module, and a content model declaration may modify an element type outside the element type set of the module.

One implementation mechanism is XML DTDs. An XML DTD is a means of describing the structure of a class of XML documents, collectively known as an XML document type. XML DTDs are described in the XML 1.0 Recommendation [XML] [p.170] . Another implementation mechanism is XML Schema [XMLSCHEMA] [p.170] .

1.3.3. Hybrid document types

A hybrid document type is an document type composed from a collection of XML DTDs or DTD Modules. The primary purpose of the modularization framework described in this document is to allow a DTD author to combine elements from multiple abstract modules into a hybrid document type, develop documents against that hybrid document type, and to validate that document against the associated hybrid document type definition.

One of the most valuable benefits of XML over SGML is that XML reduces the barrier to entry for standardization of element sets that allow communities to exchange data in an interoperable format. However, the relatively static nature of HTML as the content language for the Web has meant that any one of these communities have previously held out little hope that their XML document types would be able to see widespread adoption as part of Web standards. The modularization framework allows for the dynamic incorporation of these diverse document types within the XHTML-family of document types, further reducing the barriers to the incorporation of these domain-specific vocabularies in XHTML documents.

1.3.4. Validation

The use of well-formed, but not valid, documents is an important benefit of XML. In the process of developing a document type, however, the additional leverage provided by a validating parser for error checking is important. The same statement applies to XHTML document types with elements from multiple abstract modules.

A document is an instance of one particular document type defined by the DTD identified in the document's prologue. Validating the document is the process of checking that the document complies with the rules in the document type definition.

One document can consist of multiple document fragments. Validating only fragments of a document, where each fragment is of a different document type than the other fragments in the document, is beyond the scope of this framework - since it would require technology that is not yet defined.

However, the modularization framework allows multiple document type definitions to be integrated and form a new document type (e.g. SVG integrated into XHTML). The new document type definition can be used for normal XML 1.0 validation.

1.3.5. Formatting Model

Earlier versions of HTML attempted to define parts of the model that user agents are required to use when formatting a document. With the advent of HTML 4, the W3C started the process of divorcing presentation from structure. XHTML 1.0 maintained this separation, and this document continues moving HTML and its descendants down this path. Consequently, this document makes no requirements on the formatting model associated with the presentation of documents marked up with XHTML Family document types.

Instead, this document recommends that content authors rely upon style mechanisms such as CSS to define the formatting model for their content. When user agents support the style mechanisms, documents will format as expected. When user agents do not support the style mechanisms, documents will format as appropriate for that user agent. This permits XHTML Family user agents to support rich formatting models on devices where that is appropriate, and lean formatting models on devices where *that* is appropriate.

2. Terms and Definitions

This section is *informative*.

While some terms are defined in place, the following definitions are used throughout this document. Familiarity with the W3C XML 1.0 Recommendation [XML] [p.170] is highly recommended.

abstract module

a unit of document type specification corresponding to a distinct type of content, corresponding to a markup construct reflecting this distinct type.

content model

the declared markup structure allowed within instances of an element type. XML 1.0 differentiates two types: elements containing only element content (no character data) and mixed content (elements that may contain character data optionally interspersed with child elements). The latter are characterized by a content specification beginning with the "#PCDATA" string (denoting character data).

document model

the effective structure and constraints of a given document type. The document model constitutes the abstract representation of the physical or semantic structures of a class of documents.

document type

a class of documents sharing a common abstract structure. The ISO 8879 [SGML] [p.169] definition is as follows: "a class of documents having similar characteristics; for example, journal, article, technical manual, or memo. (4.102)"

document type definition (DTD)

a formal, machine-readable expression of the XML structure and syntax rules to which a document instance of a specific document type must conform; the schema type used in XML 1.0 to validate conformance of a document instance to its declared document type. The same markup model may be expressed by a variety of DTDs.

driver

a generally short file used to declare and instantiate the modules of a DTD. A good rule of thumb is that a DTD driver contains no markup declarations that comprise any part of the document model itself.

element

an instance of an element type.

element type

the definition of an element, that is, a container for a distinct semantic class of document content.

entity

an entity is a logical or physical storage unit containing document content. Entities may be composed of parse-able XML markup or character data, or unparsed (i.e., non-XML, possibly non-textual) content. Entity content may be either defined entirely within the document entity ("internal entities") or external to the document entity ("external entities"). In parsed entities, the replacement text may include references to other entities.

entity reference

a mnemonic string used as a reference to the content of a declared entity (eg., "&" for "&", "<" for "<", "©" for "©".)

generic identifier

the name identifying the element type of an element. Also, element type name.

hybrid document

A hybrid document is a document that uses more than one XML namespace. Hybrid documents may be defined as documents that contain elements or attributes from hybrid document types.

instantiate

to replace an entity reference with an instance of its declared content.

markup declaration

a syntactical construct within a DTD declaring an entity or defining a markup structure. Within XML DTDs, there are four specific types: entity declaration defines the binding between a mnemonic symbol and its replacement content; element declaration constrains which element types may occur as descendants within an element (see also content model); attribute definition list declaration defines the set of attributes for a given element type, and may also establish type constraints and default values; notation declaration defines the binding between a notation name and an external identifier referencing the format of an unparsed entity.

markup model

the markup vocabulary (i.e., the gamut of element and attribute names, notations, etc.) and grammar (i.e., the prescribed use of that vocabulary) as defined by a document type definition (i.e., a schema) The markup model is the concrete representation in markup syntax of the document model, and may be defined with varying levels of strict conformity. The same document model may be expressed by a variety of markup models.

module

an abstract unit within a document model expressed as a DTD fragment, used to consolidate markup declarations to increase the flexibility, modifiability, reuse and understanding of specific logical or semantic structures.

modularization

an implementation of a modularization model; the process of composing or de-composing a DTD by dividing its markup declarations into units or groups to support specific goals. Modules may or may not exist as separate file entities (i.e., the physical and logical structures of a DTD may mirror each other, but there is no such requirement).

modularization model

the abstract design of the document type definition (DTD) in support of the modularization goals, such as reuse, extensibility, expressiveness, ease of documentation, code size, consistency and intuitiveness of use. It is important to note that a modularization model is only orthogonally related to the document model it describes, so that two very different modularization models may describe the same document type.

parameter entity

an entity whose scope of use is within the document prolog (i.e., the external subset/DTD or internal subset). Parameter entities are disallowed within the document instance.

parent document type

A parent document type of a hybrid document is the document type of the root element.

tag

descriptive markup delimiting the start and end (including its generic identifier and any attributes) of an element.

3. Conformance Definition

This section is *normative*.

In order to ensure that XHTML-family documents are maximally portable among XHTML-family user agents, this specification rigidly defines conformance requirements for both of these and for XHTML-family document types. While the conformance definitions can be found in this section, they necessarily reference normative text within this document, within the base XHTML specification [XHTML1] [p.170] , and within other related specifications. It is only possible to fully comprehend the conformance requirements of XHTML through a complete reading of all normative references.

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119] [p.169] .

3.1. XHTML Host Language Document Type Conformance

It is possible to modify existing document types and define wholly new document types using both modules defined in this specification and other modules. Such a document type is "XHTML Host Language Conforming" when it meets the following criteria:

1. The document type must be defined using one of the implementation methods defined by the W3C. Currently this is limited to XML DTDs, but XML Schema will be available soon. The rest of this section refers to "DTDs" although other implementations are possible.
2. The DTD which defines the document type must have a unique identifier as defined in Naming Rules [p.18] that uses the string "XHTML" in its first token of the public text description.
3. The DTD which defines the document type must include, at a minimum, the Structure, Hypertext, Text, and List modules defined in this specification.
4. For each of the W3C-defined modules that are included, all of the elements, attributes, types of attributes (including any required enumerated value lists), and any required minimal content models must be included (and optionally extended) in the document type's content model. When content models are extended, all of the elements and attributes (along with their types or any required enumerated value lists) required in the original content model must continue to be required.
5. The DTD which defines the document type may define additional elements and attributes. However, these must be in their own XML namespace [XMLNAMES] [p.170] .

3.2. XHTML Integration Set Document Type Conformance

It is also possible to define document types that are based upon XHTML, but do not adhere to its structure. Such a document type is "XHTML Integration Set Conforming" when it meets the following criteria:

1. The document type must be defined using one of the implementation methods defined by the W3C. Currently this is limited to XML DTDs, but XML Schema will be available soon. The rest of this section refers to "DTDs" although other implementations are possible.
2. The DTD which defines the document type must have a unique identifier as defined in Naming Rules [p.18] that uses the string "XHTML" NOT in its first token of the public text description.
3. The DTD which defines the document type must include, at a minimum, the Hypertext, Text, and List modules defined in this specification.
4. For each of the W3C-defined modules that are included, all of the elements, attributes, types of attributes (including any required enumerated lists), and any required minimal content models must be included (and optionally extended) in the document type's content model. When content models are extended, all of the elements and attributes (along with their types or any required enumerated value lists) required in the original content model must continue to be required.
5. The DTD which defines the document type may define additional elements and attributes. However, these must be in their own XML namespace [XMLNAMES] [p.170] .

3.3. XHTML Family Module Conformance

This specification defines a method for defining XHTML-conforming modules. A module conforms to this specification when it meets all of the following criteria:

1. The document type must be defined using one of the implementation methods defined by the W3C. Currently this is limited to XML DTDs, but XML Schema will be available soon. The rest of this section refers to "DTDs" although other implementations are possible.
2. The DTD which defines the module must have a unique identifier as defined in Naming Rules [p.18] .
3. When the module is defined using an XML DTD, the module must insulate its parameter entity names through the use of unique prefixes or other, similar methods.
4. The module definition must have a prose definition that describes the syntactic and semantic requirements of the elements, attributes, and/or content models that it declares.
5. The module definition must not reuse any element names that are defined in other W3C-defined modules, except when the content model and semantics of those elements are either identical to the original or an extension of the original, or when the reused element names are within their own namespace (see below).
6. The module definition's elements and attributes must be part of an XML namespace [XMLNAMES] [p.170] . If the module is defined by an organization other than the W3C, this namespace must NOT be the same as the namespace in which other W3C modules are defined.

3.4. XHTML Family Document Conformance

A conforming XHTML family document is a valid instance of an XHTML Host Language Conforming Document Type.

3.5. XHTML Family User Agent Conformance

A conforming user agent must meet all of the following criteria (as defined in [XHTML1] [p.170]):

1. In order to be consistent with the XML 1.0 Recommendation [XML] [p.170] , the user agent must parse and evaluate an XHTML document for well-formedness. If the user agent claims to be a validating user agent, it must also validate documents against their referenced DTDs according to [XML] [p.170] .
2. When the user agent claims to support facilities defined within this specification or required by this specification through normative reference, it must do so in ways consistent with the facilities' definition.
3. When a user agent processes an XHTML document as generic [XML] [p.170] , it shall only recognize attributes of type ID (e.g., the id attribute on most XHTML elements) as fragment identifiers.
4. If a user agent encounters an element it does not recognize, it must continue to process the children of that element. If the content is text, the text must be presented to the user.
5. If a user agent encounters an attribute it does not recognize, it must ignore the entire attribute specification (i.e., the attribute and its value).
6. If a user agent encounters an attribute value it doesn't recognize, it must use the default attribute value.
7. If it encounters an entity reference (other than one of the predefined entities) for which the user agent has processed no declaration (which could happen if the declaration is in the external subset which the user agent hasn't read), the entity reference should be rendered as the characters (starting with the ampersand and ending with the semi-colon) that make up the entity reference.
8. When rendering content, user agents that encounter characters or character entity references that are recognized but not renderable should display the document in such a way that it is obvious to the user that normal rendering has not taken place.
9. White space is handled according to the following rules. The following characters are defined in [XML] [p.170] as white space characters:
 - SPACE ()
 - HORIZONTAL TABULATION ()
 - CARRIAGE RETURN ()
 - LINE FEED (
)

The XML processor normalizes different systems' line end codes into one single LINE FEED character, that is passed up to the application.

The user agent must process white space characters in the data received from the XML processor as follows:

- All white space surrounding block elements should be removed.
- Comments are removed entirely and do not affect white space handling. One white space character on either side of a comment is treated as two white space characters.

- When the 'xml:space' attribute is set to 'preserve', white space characters must be preserved and consequently LINE FEED characters within a block must not be converted.
- When the 'xml:space' attribute is not set to 'preserve', then:
 - Leading and trailing white space inside a block element must be removed.
 - LINE FEED characters must be converted into one of the following characters: a SPACE character, a ZERO WIDTH SPACE character (​), or no character (i.e. removed). The choice of the resulting character is user agent dependent and is conditioned by the script property of the characters preceding and following the LINE FEED character.
 - A sequence of white space characters without any LINE FEED characters must be reduced to a single SPACE character.
 - A sequence of white space characters with one or more LINE FEED characters must be reduced in the same way as a single LINE FEED character.

White space in attribute values is processed according to [XML] [p.170] .

Note (*informative*): In determining how to convert a LINE FEED character a user agent should consider the following cases, whereby the script of characters on either side of the LINE FEED determines the choice of the replacement. Characters of COMMON script (such as punctuation) are treated as the same as the script on the other side:

1. If the characters preceding and following the LINE FEED character belong to a script in which the SPACE character is used as a word separator, the LINE FEED character should be converted into a SPACE character. Examples of such scripts are Latin, Greek, and Cyrillic.
2. If the characters preceding and following the LINE FEED character belong to an ideographic-based script or writing system in which there is no word separator, the LINE FEED should be converted into no character. Examples of such scripts or writing systems are Chinese, Japanese.
3. If the characters preceding and following the LINE FEED character belong to a non ideographic-based script in which there is no word separator, the LINE FEED should be converted into a ZERO WIDTH SPACE character (​) or no character. Examples of such scripts are Thai, Khmer.
4. If none of the conditions in (1) through (3) are true, the LINE FEED character should be converted into a SPACE character.

The Unicode [UNICODE] [p.170] technical report TR#24 (Script Names) provides an assignment of script names to all characters.

3.6. Naming Rules

XHTML Host Language document types must adhere to strict naming conventions so that it is possible for software and users to readily determine the relationship of document types to XHTML. The names for document types implemented as XML document type definitions are defined through Formal Public Identifiers (FPIs). Within FPIs, fields are separated by double

slash character sequences (/ /). The various fields must be composed as follows:

1. The leading field must be "-" to indicate a privately defined resource.
2. The second field must contain the name of the organization responsible for maintaining the named item. There is no formal registry for these organization names. Each organization should define a name that is unique. The name used by the W3C is, for example, W3C.
3. The third field contains two constructs: the public text class followed by the public text description. The first token in the third field is the public text class which should adhere to ISO 8879 Clause 10.2.2.1 Public Text Class. Only XHTML Host Language conforming documents should begin the public text description with the token XHTML. The public text description should contain the string XHTML if the document type is Integration Set conforming. The field must also contain an organization-defined unique identifier (e.g., MyML 1.0). This identifier should be composed of a unique name and a version identifier that can be updated as the document type evolves.
4. The fourth field defines the language in which the item is developed (e.g., EN).

Using these rules, the name for an XHTML Host Language conforming document type might be `-//MyCompany//DTD XHTML MyML 1.0//EN`. The name for an XHTML family conforming module might be `-//MyCompany//ELEMENTS XHTML MyElements 1.0//EN`. The name for an XHTML Integration Set conforming document type might be `-//MyCompany//DTD Special Markup with XHTML//EN`.

3.7. XHTML Module Evolution

Each module defined in this specification is given a unique identifier that adheres to the naming rules in the previous section. Over time, a module may evolve. A logical ramification of such evolution may be that some aspects of the module are no longer compatible with its previous definition. To help ensure that document types defined against modules defined in this specification continue to operate, the identifiers associated with a module that changes will be updated. Specifically, the Formal Public Identifier and System Identifier of the module will be changed by modifying the version identifier included in each. Document types that wish to incorporate the updated functionality will need to be similarly updated.

In addition, the earlier version(s) of the module will continue to be available via its earlier, unique identifier(s). In this way, document types developed using XHTML modules will continue to function seamlessly using their original definitions even as the collection expands and evolves. Similarly, document instances written against such document types will continue to validate using the earlier module definitions.

Other XHTML Family Module and Document Type authors are encouraged to adopt a similar strategy to ensure the continued functioning of document types based upon those modules and document instances based upon those document types.

4. Defining Abstract Modules

This section is *normative*.

An abstract module is a definition of an XHTML module using prose text and some informal markup conventions. While such a definition is not generally useful in the machine processing of document types, it is critical in helping people understand what is contained in a module. This section defines the way in which XHTML abstract modules are defined. An XHTML-conforming module is *not required* to provide an abstract module definition. However, anyone developing an XHTML module is encouraged to provide an abstraction to ease in the use of that module.

4.1. Syntactic Conventions

The abstract modules are not defined in a formal grammar. However, the definitions do adhere to the following syntactic conventions. These conventions are similar to those of XML DTDs, and should be familiar to XML DTD authors. Each discrete syntactic element can be combined with others to make more complex expressions that conform to the algebra defined here.

element name

When an element is included in a content model, its explicit name will be listed.

content set

Some modules define lists of explicit element names called *content sets*. When a content set is included in a content model, its name will be listed.

expr ?

Zero or one instances of expr are permitted.

expr +

One or more instances of expr are required.

expr *

Zero or more instances of expr are permitted.

a , b

Expression a is required, followed by expression b.

a | b

Either expression a or expression b is required.

a - b

Expression a is permitted, omitting elements in expression b.

parentheses

When an expression is contained within parentheses, evaluation of any subexpressions within the parentheses take place before evaluation of expressions outside of the parentheses (starting at the deepest level of nesting first).

extending pre-defined elements

In some instances, a module adds attributes to an element. In these instances, the element name is followed by an ampersand (&).

defining required attributes

When an element requires the definition of an attribute, that attribute name is followed by an asterisk (*).

defining the type of attribute values

When a module defines the type of an attribute value, it does so by listing the type in parentheses after the attribute name.

defining the legal values of attributes

When a module defines the legal values for an attribute, it does so by listing the explicit legal values (enclosed in quotation marks), separated by vertical bars (|), inside of parentheses following the attribute name. If the attribute has a default value, that value is followed by an asterisk (*). If the attribute has a fixed value, the attribute name is followed by an equals sign (=) and the fixed value enclosed in quotation marks.

4.2. Content Types

Abstract module definitions define minimal, atomic content models for each module. These minimal content models reference the elements in the module itself. They may also reference elements in other modules upon which the abstract module depends. Finally, the content model in many cases requires that text be permitted as content to one or more elements. In these cases, the symbol used for text is PCDATA. This is a term, defined in the XML 1.0 Recommendation, that refers to processed character data. A content type can also be defined as EMPTY, meaning the element has no content in its minimal content model.

4.3. Attribute Types

In some instances, it is necessary to define the types of attribute values or the explicit set of permitted values for attributes. The following attribute types (defined in the XML 1.0 Recommendation) are used in the definitions of the abstract modules:

Attribute Type	Definition
CDATA	Character data
ID	A document-unique identifier
IDREF	A reference to a document-unique identifier
IDREFS	A space-separated list of references to document-unique identifiers
NAME	A name with the same character constraints as ID above
NMTOKEN	A name composed of only name tokens as defined in XML 1.0 [XML] [p.170]
NMTOKENS	One or more white space separated NMTOKEN values
PCDATA	Processed character data

In addition to these pre-defined data types, XHTML Modularization defines the following data types and their semantics (as appropriate):

Data type	Description		
Character	A single character from [ISO10646] [p.169] .		
Charset	A character encoding, as per [RFC2045] [p.169] .		
Charsets	A space-separated list of character encodings, as per [RFC2045] [p.169] .		
Color	<p>The attribute value type "Color" refers to color definitions as specified in [SRGB] [p.169] . A color value may either be a hexadecimal number (prefixed by a hash mark) or one of the following sixteen color names. The color names are case-insensitive.</p> <p style="text-align: center;">Color names and sRGB values</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50%; vertical-align: top;">  Black = "#000000"  Silver = "#C0C0C0"  Gray = "#808080"  White = "#FFFFFF"  Maroon = "#800000"  Red = "#FF0000"  Purple = "#800080"  Fuchsia = "#FF00FF" </td> <td style="width: 50%; vertical-align: top;">  Green = "#008000"  Lime = "#00FF00"  Olive = "#808000"  Yellow = "#FFFF00"  Navy = "#000080"  Blue = "#0000FF"  Teal = "#008080"  Aqua = "#00FFFF" </td> </tr> </table> <p>Thus, the color values "#800080" and "Purple" both refer to the color purple.</p>	 Black = "#000000"  Silver = "#C0C0C0"  Gray = "#808080"  White = "#FFFFFF"  Maroon = "#800000"  Red = "#FF0000"  Purple = "#800080"  Fuchsia = "#FF00FF"	 Green = "#008000"  Lime = "#00FF00"  Olive = "#808000"  Yellow = "#FFFF00"  Navy = "#000080"  Blue = "#0000FF"  Teal = "#008080"  Aqua = "#00FFFF"
 Black = "#000000"  Silver = "#C0C0C0"  Gray = "#808080"  White = "#FFFFFF"  Maroon = "#800000"  Red = "#FF0000"  Purple = "#800080"  Fuchsia = "#FF00FF"	 Green = "#008000"  Lime = "#00FF00"  Olive = "#808000"  Yellow = "#FFFF00"  Navy = "#000080"  Blue = "#0000FF"  Teal = "#008080"  Aqua = "#00FFFF"		
ContentType	A media type, as per [RFC2045] [p.169] .		
ContentTypes	A comma-separated list of media types, as per [RFC2045] [p.169] .		
Coords	Comma separated list of coordinates to use in defining areas.		
Datetime	Date and time information.		
FPI	A character string representing an SGML Formal Public Identifier.		
FrameTarget	Frame name used as destination for results of certain actions.		
LanguageCode	A language code, as per [RFC3066] [p.169] .		
Length	The value may be either in pixels or a percentage of the available horizontal or vertical space. Thus, the value "50%" means half of the available space.		

LinkTypes	<p>Authors may use the following recognized link types, listed here with their conventional interpretations. A LinkTypes value refers to a space-separated list of link types. White space characters are not permitted within link types.</p> <p>These link types are case-insensitive, i.e., "Alternate" has the same meaning as "alternate".</p> <p>User agents, search engines, etc. may interpret these link types in a variety of ways. For example, user agents may provide access to linked documents through a navigation bar.</p> <p>Alternate Designates substitute versions for the document in which the link occurs. When used together with the <code>hreflang</code> attribute, it implies a translated version of the document. When used together with the <code>media</code> attribute, it implies a version designed for a different medium (or media).</p> <p>Stylesheet Refers to an external style sheet. See the Style Module [p.45] for details. This is used together with the link type "Alternate" for user-selectable alternate style sheets.</p> <p>Start Refers to the first document in a collection of documents. This link type tells search engines which document is considered by the author to be the starting point of the collection.</p> <p>Next Refers to the next document in a linear sequence of documents. User agents may choose to pre-load the "next" document, to reduce the perceived load time.</p> <p>Prev Refers to the previous document in an ordered series of documents. Some user agents also support the synonym "Previous".</p> <p>Contents Refers to a document serving as a table of contents. Some user agents also support the synonym <i>ToC</i> (from "Table of Contents").</p> <p>Index Refers to a document providing an index for the current document.</p> <p>Glossary Refers to a document providing a glossary of terms that pertain to the current document.</p> <p>Copyright Refers to a copyright statement for the current document.</p> <p>Chapter Refers to a document serving as a chapter in a collection of documents.</p> <p>Section Refers to a document serving as a section in a collection of documents.</p> <p>Subsection Refers to a document serving as a subsection in a collection of documents.</p> <p>Appendix Refers to a document serving as an appendix in a collection of documents.</p> <p>Help Refers to a document offering help (more information, links to other sources information, etc.)</p> <p>Bookmark Refers to a bookmark. A bookmark is a link to a key entry point within an extended document. The title attribute may be used, for example, to label the bookmark. Note that several bookmarks may be defined in each document.</p>
-----------	--

MediaDesc	<p>The MediaDesc attribute is a comma-separated list of media descriptors. The following is a list of recognized media descriptors:</p> <p>screen Intended for non-paged computer screens.</p> <p>tty Intended for media using a fixed-pitch character grid, such as teletypes, terminals, or portable devices with limited display capabilities.</p> <p>tv Intended for television-type devices (low resolution, color, limited scrollability).</p> <p>projection Intended for projectors.</p> <p>handheld Intended for handheld devices (small screen, monochrome, bitmapped graphics, limited bandwidth).</p> <p>print Intended for paged, opaque material and for documents viewed on screen in print preview mode.</p> <p>braille Intended for braille tactile feedback devices.</p> <p>aural Intended for speech synthesizers.</p> <p>all Suitable for all devices.</p> <p>Future versions of XHTML may introduce new values and may allow parameterized values. To facilitate the introduction of these extensions, conforming user agents must be able to parse the media attribute value as follows:</p> <ol style="list-style-type: none"> The value is a comma-separated list of entries. For example, <pre>media="screen, 3d-glasses, print and resolution > 90dpi"</pre> <p>is mapped to:</p> <pre>"screen" "3d-glasses" "print and resolution > 90dpi"</pre> Each entry is truncated just before the first character that isn't a US ASCII letter [a-zA-Z] (ISO 10646 hex 41-5a, 61-7a), digit [0-9] (hex 30-39), or hyphen-minus (hex 2d). In the example, this gives: <pre>"screen" "3d-glasses" "print"</pre> A case-insensitive match is then made with the set of media types defined above. User agents may ignore entries that don't match. In the example we are left with <code>screen</code> and <code>print</code>. <p>Note. <i>Style sheets may include media-dependent variations within them (e.g., the CSS @media construct). In such cases it may be appropriate to use "media =all".</i></p>
-----------	---

MultiLength	The value may be a Length or a relative length. A relative length has the form "i*", where "i" is an integer. When allotting space among elements competing for that space, user agents allot pixel and percentage lengths first, then divide up remaining available space among relative lengths. Each relative length receives a portion of the available space that is proportional to the integer preceding the "*". The value "*" is equivalent to "1*". Thus, if 60 pixels of space are available after the user agent allots pixel and percentage space, and the competing relative lengths are 1*, 2*, and 3*, the 1* will be allotted 10 pixels, the 2* will be allotted 20 pixels, and the 3* will be allotted 30 pixels.
MultiLengths	A comma separated list of items of type MultiLength [p.26] .
Number	One or more digits
Pixels	The value is an integer that represents the number of pixels of the canvas (screen, paper). Thus, the value "50" means fifty pixels. For normative information about the definition of a pixel, please consult [CSS2] [p.169]
Script	Script data can be the content of the "script" element and the value of intrinsic event attributes. User agents must not evaluate script data as HTML markup but instead must pass it on as data to a script engine. The case-sensitivity of script data depends on the scripting language. Please note that script data that is element content may not contain character references, but script data that is the value of an attribute may contain them.
Shape	The shape of a region.
Text	Arbitrary textual data, likely meant to be human-readable.
URI	A Uniform Resource Identifier, as per [URI] [p.170] .
URIs	A space-separated list of Uniform Resource Identifiers, as per [URI] [p.170] .

4.4. An Example Abstract Module Definition

This section is informative

This section defines a sample abstract module as an example of how to take advantage of the syntax rules defined above. Since this example is trying to use all of the various syntactic elements defined, it is pretty complicated. Typical module definitions would be much simpler than this. Finally, note that this module references the attribute collection Common. This is a collection defined in the XHTML Modularization specification that includes all of the basic attributes that most elements need.

4.4.1. XHTML Skiing Module

The XHTML Skiing Module defines markup used when describing aspects of a ski lodge. The elements and attributes defined in this module are:

Elements	Attributes	Minimal Content Model
resort	Common, href (CDATA)	description, Aspen+
lodge	Common	description, (Aspen - lift)+
lift	Common, href	description?
chalet	Common, href	description?
room	Common, href	description?
lobby	Common, href	description?
fireplace	Common, href	description?
description	Common	PCDATA*

This module also defines the content set Aspen with the minimal content model lodge | lift | chalet | room | lobby | fireplace.

5. XHTML Abstract Modules

This section is *normative*.

This section specifies the contents of the XHTML abstract modules. These modules are abstract definitions of collections of elements, attributes, and their content models. These abstract modules can be mapped onto any appropriate specification mechanism. XHTML DTD Module Implementations [p.79] , for example, maps these modules onto DTDs as described in [XML] [p.170] .

Content developers and device designers should view this section as a guide to the definition of the functionality provided by the various XHTML-defined modules. When developing documents or defining a profile for a class of documents, content developers can determine which of these modules are essential for conveying their message. When designing clients, device designers should develop their device profiles by choosing from among the abstract modules defined here.

Except when overridden in this document, the semantics of these elements and attributes are defined in [HTML4] [p.169] .

5.1. Attribute Collections

Many of the abstract modules in this section define the required attributes for elements. The table below defines some collections of attributes that are referenced throughout the modules. These expressions should in no way be considered normative or mandatory. They are an editorial convenience for this document. When used in the remainder of this section, it is the expansion of the term that is normative, not the term itself.

The following basic attribute sets are used on many elements. In each case where they are used, their use is identified via their collection name rather than enumerating the list.

Collection Name	Attributes in Collection
Core	class (NMTOKENS [p.22]), id (ID [p.22]), title (CDATA [p.22])
I18N	xml:lang (NMTOKEN [p.22])
Events	onclick (Script [p.26]), ondblclick (Script [p.26]), onmousedown (Script [p.26]), onmouseup (Script [p.26]), onmouseover (Script [p.26]), onmousemove (Script [p.26]), onmouseout (Script [p.26]), onkeypress (Script [p.26]), onkeydown (Script [p.26]), onkeyup (Script [p.26])
Style	style (CDATA [p.22])
Common	Core [p.29] + Events [p.29] + I18N [p.29] + Style [p.29]

Note that the Events collection is only defined when the Intrinsic Events Module is selected. Otherwise, the Events collection is empty.

Also note that the Style collection is only defined when the Style Attribute Module is selected. Otherwise, the Style collection is empty.

5.2. Core Modules

The core modules are modules that are required to be present in any XHTML Family Conforming Document Type [p.15] .

5.2.1. Structure Module

The Structure Module defines the major structural elements for XHTML. These elements effectively act as the basis for the content model of many XHTML family document types. The elements and attributes included in this module are:

Elements	Attributes	Minimal Content Model
body	Common [p.29]	(Heading Block List)*
head	l18N [p.29] , profile (URI [p.26])	title
html	l18N [p.29] , version (CDATA [p.22]), xmlns (URI [p.26] = "http://www.w3.org/1999/xhtml")	head, body
title	l18N [p.29]	PCDATA

This module is the basic structural definition for XHTML content. The `html` element acts as the root element for all XHTML Family Document Types.

Note that the value of the `xmlns` attribute is defined to be "http://www.w3.org/1999/xhtml". Also note that because the `xmlns` attribute is treated specially by XML namespace-aware parsers [XMLNAMES [p.170]], it is legal to have it present as an attribute of each element. However, any time the `xmlns` attribute is used in the context of an XHTML module, whether with a prefix or not, the value of the attribute shall be the XHTML namespace defined here. See Defining the Namespace of a Module [p.58] for more on rules regarding namespace usage with XHTML family modules.

Implementation: DTD [p.99]

5.2.2. Text Module

This module defines all of the basic text container elements, attributes, and their content model:

Element	Attributes	Minimal Content Model
abbr	Common [p.29]	(PCDATA Inline)*
acronym	Common [p.29]	(PCDATA Inline)*
address	Common [p.29]	(PCDATA Inline)*
blockquote	Common [p.29] , cite (URI [p.26])	(PCDATA Heading Block List)*
br	Core [p.29]	EMPTY
cite	Common [p.29]	(PCDATA Inline)*
code	Common [p.29]	(PCDATA Inline)*
dfn	Common [p.29]	(PCDATA Inline)*
div	Common [p.29]	(PCDATA Flow)*
em	Common [p.29]	(PCDATA Inline)*
h1	Common [p.29]	(PCDATA Inline)*
h2	Common [p.29]	(PCDATA Inline)*
h3	Common [p.29]	(PCDATA Inline)*
h4	Common [p.29]	(PCDATA Inline)*
h5	Common [p.29]	(PCDATA Inline)*
h6	Common [p.29]	(PCDATA Inline)*
kbd	Common [p.29]	(PCDATA Inline)*
p	Common [p.29]	(PCDATA Inline)*
pre	Common [p.29] , xml:space="preserve"	(PCDATA Inline)*
q	Common [p.29] , cite (URI [p.26])	(PCDATA Inline)*
samp	Common [p.29]	(PCDATA Inline)*
span	Common [p.29]	(PCDATA Inline)*
strong	Common [p.29]	(PCDATA Inline)*
var	Common [p.29]	(PCDATA Inline)*

The minimal content model for this module defines some content sets:

Heading

h1 | h2 | h3 | h4 | h5 | h6

Block

address | blockquote | div | p | pre

Inline

abbr | acronym | br | cite | code | dfn | em | kbd | q | samp | span | strong | var

Flow

Heading | Block | Inline

Implementation: DTD [p.101]

5.2.3. Hypertext Module

The Hypertext Module provides the element that is used to define hypertext links to other resources. This module supports the following element and attributes:

Element	Attributes	Minimal Content Model
a	Common [p.29] , accesskey (Character [p.23]), charset (Charset [p.23]), href (URI [p.26]), hreflang (LanguageCode [p.23]), rel (LinkTypes [p.24]), rev (LinkTypes [p.24]), tabindex (Number [p.26]), type (ContentType [p.23])	(PCDATA Inline - a)*

This module adds the a element to the Inline content set of the Text Module.

Implementation: DTD [p.102]

5.2.4. List Module

As its name suggests, the List Module provides list-oriented elements. Specifically, the List Module supports the following elements and attributes:

Elements	Attributes	Minimal Content Model
dl	Common [p.29]	(dt dd)+
dt	Common [p.29]	(PCDATA Inline)*
dd	Common [p.29]	(PCDATA Flow)*
ol	Common [p.29]	li+
ul	Common [p.29]	li+
li	Common [p.29]	(PCDATA Flow)*

This module also defines the content set List with the minimal content model (dl | ol | ul)+ and adds this set to the Flow content set of the Text Module.

Implementation: DTD [p.103]

5.3. Applet Module

This module is deprecated. Similar functionality can be found in the Object Module [p.42].

The Applet Module provides elements for referencing external applications. Specifically, the Applet Module supports the following elements and attributes:

Element	Attributes	Minimal Content Model
applet	Core, alt* (Text [p.26]), archive (CDATA [p.22]), code (CDATA [p.22]), codebase (URI [p.26]), height* (Length [p.23]), object (CDATA [p.22]), width* (Length [p.23])	(PCDATA Flow param)*
param	id (ID [p.22]), name* (CDATA [p.22]), type (ContentType [p.23]), value (CDATA [p.22]), valuetype ("data"* "ref" "object")	EMPTY

When the Applet Module is used, it adds the `applet` element to the Inline content set of the Text Module.

Implementation: DTD [p.105]

5.4. Text Extension Modules

This section defines a variety of additional textual markup modules.

5.4.1. Presentation Module

This module defines elements, attributes, and a minimal content model for simple presentation-related markup:

Element	Attributes	Minimal Content Model
b	Common [p.29]	(PCDATA Inline)*
big	Common [p.29]	(PCDATA Inline)*
hr	Common [p.29]	EMPTY
i	Common [p.29]	(PCDATA Inline)*
small	Common [p.29]	(PCDATA Inline)*
sub	Common [p.29]	(PCDATA Inline)*
sup	Common [p.29]	(PCDATA Inline)*
tt	Common [p.29]	(PCDATA Inline)*

When this module is used, the `hr` element is added to the Block content set of the Text Module. In addition, the `b`, `big`, `i`, `small`, `sub`, `sup`, and `tt` elements are added to the Inline content set of the Text Module.

Implementation: DTD [p.106]

5.4.2. Edit Module

This module defines elements and attributes for use in editing-related markup:

Element	Attributes	Minimal Content Model
del	Common [p.29] , cite (URI [p.26]) , datetime (Datetime [p.23])	(PCDATA Flow)*
ins	Common [p.29] , cite (URI [p.26]) , datetime (Datetime [p.23])	(PCDATA Flow)*

When this module is used, the `del` and `ins` elements are added to the Inline content set of the Text Module.

Implementation: DTD [p.107]

5.4.3. Bi-directional Text Module

The Bi-directional Text module defines an element that can be used to declare the bi-directional rules for the element's content.

Elements	Attributes	Minimal Content Model
bdo	Core [p.29] , dir* ("ltr" "rtl")	(PCDATA Inline)*

When this module is used, the `bdo` element is added to the Inline content set of the Text Module. Selecting this module also adds the attribute `dir* ("ltr" | "rtl")` to the I18N attribute collection.

Implementation: DTD [p.108]

5.5. Forms Modules

5.5.1. Basic Forms Module

The Basic Forms Module provides the form-related elements, but only in a limited form. Specifically, the Basic Forms Module supports the following elements, attributes, and minimal content model:

Elements	Attributes	Minimal Content Model
form	Common [p.29] , action* (URI [p.26]), method ("get"* "post"), enctype (ContentType [p.23])	(Heading List Block - form)+
input	Common [p.29] , accesskey (Character [p.23]), checked ("checked"), maxlength (Number [p.26]), name (CDATA [p.22]), size (Number [p.26]), src (URI [p.26]), tabindex (Number [p.26]), type ("text"* "password" "checkbox" "radio" "submit" "reset" "hidden"), value (CDATA [p.22])	EMPTY
label	Common [p.29] , accesskey (Character [p.23]), for (IDREF [p.22])	(PCDATA Inline - label)*
select	Common [p.29] , multiple ("multiple"), name (CDATA [p.22]), size (Number [p.26]), tabindex (Number [p.26])	option+
option	Common [p.29] , selected ("selected"), value (CDATA [p.22])	PCDATA
textarea	Common [p.29] , accesskey (Character [p.23]), cols* (Number [p.26]), name (CDATA [p.22]), rows* (Number [p.26]), tabindex (Number [p.26])	PCDATA

This module defines two content sets:

Form

form

Formctrl

input | label | select | textarea

When this module is used, it adds the Form content set to the Block content set and it adds the Formctrl content set to the Inline content set as these are defined in the Text Module.

Implementation: DTD [p.109]

5.5.2. Forms Module

The Forms Module provides all of the forms features found in HTML 4.0. Specifically, the Forms Module supports:

Elements	Attributes	Minimal Content Model
form	Common [p.29] , accept (ContentTypes [p.23]) , accept-charset (Charsets [p.23]) , action* (URI [p.26]) , method ("get"* "post") , enctype (ContentType [p.23])	(Heading List Block - form fieldset)+
input	Common [p.29] , accept (ContentTypes [p.23]) , accesskey (Character [p.23]) , alt (Text [p.26]) , checked ("checked") , disabled ("disabled") , maxlength (Number [p.26]) , name (CDATA [p.22]) , readonly ("readonly") , size (Number [p.26]) , src (URI [p.26]) , tabindex (Number [p.26]) , type ("text"* "password" "checkbox" "button" "radio" "submit" "reset" "file" "hidden" "image") , value (CDATA [p.22])	EMPTY
select	Common [p.29] , disabled ("disabled") , multiple ("multiple") , name (CDATA [p.22]) , size (Number [p.26]) , tabindex (Number [p.26])	(optgroup option)+
option	Common [p.29] , disabled ("disabled") , label (Text [p.26]) , selected ("selected") , value (CDATA [p.22])	PCDATA
textarea	Common [p.29] , accesskey (Character [p.23]) , cols* (Number [p.26]) , disabled ("disabled") , name (CDATA [p.22]) , readonly ("readonly") , rows* (Number [p.26]) , tabindex (Number [p.26])	PCDATA
button	Common [p.29] , accesskey (Character [p.23]) , disabled ("disabled") , name (CDATA [p.22]) , tabindex (Number [p.26]) , type ("button" "submit"* "reset") , value (CDATA [p.22])	(PCDATA Heading List Block - Form Inline - Formctrl)*
fieldset	Common [p.29]	(PCDATA legend Flow)*
label	Common [p.29] , accesskey (Character [p.23]) , for (IDREF [p.22])	(PCDATA Inline - label)*
legend	Common [p.29] , accesskey (Character [p.23])	(PCDATA Inline)+
optgroup	Common [p.29] , disabled ("disabled") , label* (Text [p.26])	option+

This module defines two content sets:

Form

form | fieldset

Formctrl

input | select | textarea | label | button

When this module is used, it adds the Form content set to the Block content set and it adds the Formctrl content set to the Inline content set as these are defined in the Text Module.

The Forms Module is a superset of the Basic Forms Module. These modules may not be used together in a single document type.

Implementation: DTD [p.112]

5.6. Table Modules

5.6.1. Basic Tables Module

The Basic Tables Module provides table-related elements, but only in a limited form. Specifically, the Basic Tables Module supports:

Elements	Attributes	Minimal Content Model
caption	Common [p.29]	(PCDATA Inline)*
table	Common [p.29] , summary (Text [p.26]), width (Length [p.23])	caption?, tr+
td	Common [p.29] , abbr (Text [p.26]), align ("left" "center" "right"), axis (CDATA [p.22]), colspan (Number [p.26]), headers (IDREFS [p.22]), rowspan (Number [p.26]), scope ("row" "col"), valign ("top" "middle" "bottom")	(PCDATA Flow - table)*
th	Common [p.29] , abbr (Text [p.26]), align ("left" "center" "right"), axis (CDATA [p.22]), colspan (Number [p.26]), headers (IDREFS [p.22]), rowspan (Number [p.26]), scope ("row" "col"), valign ("top" "middle" "bottom")	(PCDATA Flow - table)*
tr	Common [p.29] , align ("left" "center" "right"), valign ("top" "middle" "bottom")	(td th)+

When this module is used, it adds the `table` element to the Block content set as defined in the Text Module.

Implementation: DTD [p.118]

5.6.2. Tables Module

As its name suggests, the Tables Module provides table-related elements that are better able to be accessed by non-visual user agents. Specifically, the Tables Module supports the following elements, attributes, and content model:

Elements	Attributes	Minimal Content Model
caption	Common [p.29]	(PCDATA Inline)*
table	Common [p.29] , border (Pixels [p.26]), cellpadding (Length [p.23]), cellspacing (Length [p.23]), datapagesize (CDATA [p.22]), frame ("void" "above" "below" "hsides" "lhs" "rhs" "vsides" "box" "border"), rules ("none" "groups" "rows" "cols" "all"), summary (Text [p.26]), width (Length [p.23])	caption?, (col* colgroup*), ((thead?, tfoot?, tbody+) (tr+))
td	Common [p.29] , abbr (Text [p.26]), align ("left" "center" "right" "justify" "char"), axis (CDATA [p.22]), char (Character [p.23]), charoff (Length [p.23]), colspan (Number [p.26]), headers (IDREFS [p.22]), rowspan (Number [p.26]), scope ("row", "col", "rowgroup", "colgroup"), valign ("top" "middle" "bottom" "baseline")	(PCDATA Flow)*
th	Common [p.29] , abbr (Text [p.26]), align ("left" "center" "right" "justify" "char"), axis (CDATA [p.22]), char (Character [p.23]), charoff (Length [p.23]), colspan (Number [p.26]), headers (IDREFS [p.22]), rowspan (Number [p.26]), scope ("row", "col", "rowgroup", "colgroup"), valign ("top" "middle" "bottom" "baseline")	(PCDATA Flow)*
tr	Common [p.29] , align ("left" "center" "right" "justify", "char"), char (Character [p.23]), charoff (Length [p.23]), valign ("top" "middle" "bottom" "baseline")	(td th)+
col	Common [p.29] , align ("left" "center" "right" "justify", "char"), char (Character [p.23]), charoff (Length [p.23]), span (Number [p.26]), valign ("top" "middle" "bottom" "baseline"), width (MultiLength [p.26])	EMPTY
colgroup	Common [p.29] , align ("left" "center" "right" "justify", "char"), char (Character [p.23]), charoff (Length [p.23]), span (Number [p.26]), valign ("top" "middle" "bottom" "baseline"), width (MultiLength [p.26])	col*
tbody	Common [p.29] , align ("left" "center" "right" "justify", "char"), char (Character [p.23]), charoff (Length [p.23]), valign ("top" "middle" "bottom" "baseline")	tr+
thead	Common [p.29] , align ("left" "center" "right" "justify", "char"), char (Character [p.23]), charoff (Length [p.23]), valign ("top" "middle" "bottom" "baseline")	tr+

Elements	Attributes	Minimal Content Model
tfoot	Common [p.29] , align ("left" "center" "right" "justify", "char"), char (Character [p.23]), charoff (Length [p.23]), valign ("top" "middle" "bottom" "baseline")	tr+

When this module is used, it adds the `tfoot` element to the Block content set of the Text Module.

Implementation: DTD [p.121]

5.7. Image Module

The Image Module provides basic image embedding, and may be used in some implementations independently of client side image maps. The Image Module supports the following element and attributes:

Elements	Attributes	Minimal Content Model
img	Common [p.29] , alt* (Text [p.26]), height (Length [p.23]), longdesc (URI [p.26]), src* (URI [p.26]), width (Length [p.23])	EMPTY

When this module is used, it adds the `img` element to the Inline content set of the Text Module.

Implementation: DTD [p.127]

5.8. Client-side Image Map Module

The Client-side Image Map Module provides elements for client side image maps. It requires that the Image Module (or another module that supports the `img` element) be included. The Client-side Image Map Module supports the following elements:

Elements	Attributes	Minimal Content Model
a&	coords (CDATA [p.22]), shape ("rect" "circle" "poly" "default")	n/a
area	Common [p.29] , accesskey (Character [p.23]), alt* (Text [p.26]), coords (CDATA [p.22]), href (URI [p.26]), nohref ("nohref"), shape ("rect"* "circle" "poly" "default"), tabindex (Number [p.26])	EMPTY
img&	usemap (IDREF [p.22])	n/a
input&	usemap (IDREF [p.22])	n/a
map	l18N [p.29] , Events [p.29] , class (NMTOKEN [p.22]), id* (ID [p.22]), title (CDATA [p.22])	((Heading Block) area)+
object&	usemap (IDREF [p.22])	Note: Only when the object module is included

When this module is used, the `map` element is added to the Inline content set of the Text Module.

Implementation: DTD [p.128]

5.9. Server-side Image Map Module

The Server-side Image Map Module provides support for image-selection and transmission of selection coordinates. It requires that the Image Module (or another module that supports the `img` element) be included. The Server-side Image Map Module supports the following attributes:

Elements	Attributes	Minimal Content Model	Notes
img&	ismap ("ismap")	n/a	
input&	ismap ("ismap")	n/a	When the Forms or Basic Forms Module is selected.

Implementation: DTD [p.130]

5.10. Object Module

The Object Module provides elements for general-purpose object inclusion. Specifically, the Object Module supports:

Elements	Attributes	Minimal Content Model
object	Common, archive (URI [p.26]), classid (URI [p.26]), codebase (URI [p.26]), codetype (ContentType [p.23]), data (URI [p.26]), declare ("declare"), height (Length [p.23]), name (CDATA [p.22]), standby (Text [p.26]), tabindex (Number [p.26]), type (ContentType [p.23]), width (Length [p.23])	(PCDATA Flow param)*
param	id (ID [p.22]), name* (CDATA [p.22]), type (ContentType [p.23]), value (CDATA [p.22]), valuetype ("data"* "ref" "object")	EMPTY

When this module is used, it adds the `object` element to the Inline content set of the Text Module.

Implementation: DTD [p.130]

5.11. Frames Module

As its name suggests, the Frames Module provides frame-related elements. Specifically, the Frames Module supports:

Elements	Attributes	Minimal Content Model
frameset	Core [p.29] , cols (MultiLength [p.26]), rows (MultiLength [p.26])	(frameset frame)+, noframes?
frame	Core [p.29] , frameborder ("1" "0"), longdesc (URI [p.26]), marginheight (Pixels [p.26]), marginwidth (Pixels [p.26]), noresize ("noresize"), scrolling ("yes" "no" "auto"*), src (URI [p.26])	EMPTY
noframes	Common [p.29]	body

When this module is selected, the minimal content model of the `html` element of the Structure Module is changed to (head, frameset).

Implementation: DTD [p.131]

5.12. Target Module

The content of a frame can specify destination targets for a selection. This module adds the `target` element to the area and link defining elements. This is defined as a separate module so it can be included in documents that will be included in frames and documents that use the `target` feature to open a new window.

Elements	Attributes	Notes
a&	target (CDATA [p.23])	
area&	target (CDATA [p.23])	When the Client-side Image Map Module is selected.
base&	target (CDATA [p.23])	When the Legacy Module is selected.
link&	target (CDATA [p.23])	When the Link Module is selected.
form&	target (CDATA [p.23])	When the Basic Forms or Forms module is selected.

Implementation: DTD [p.133]

5.13. Iframe Module

The Iframe Module defines an element for the definition of inline frames. The element and attribute included in this module are:

Elements	Attributes	Minimal Content Model
iframe	Core [p.29] , frameborder ("1" "0"), height (Length [p.23]), longdesc (URI [p.26]), marginheight (Pixels [p.26]), marginwidth (Pixels [p.26]), scrolling ("yes" "no" "auto"*), src (URI [p.26]), width (Length [p.23])	(PCDATA Flow)*

When this module is used, the `iframe` element is added to the Inline content set as defined by the Text Module.

Implementation: DTD [p.134]

5.14. Intrinsic Events Module

Intrinsic events are attributes that are used in conjunction with elements that can have specific events occur when certain actions are performed by the user. The attributes indicated in the following table are added to the attribute set for their respective elements *only* when the modules defining those elements are selected. Note also that selection of this module defines the attribute collection Events [p.29] as described above. Attributes defined by this module are:

Elements	Attributes	Notes
a&	onblur (Script [p.26]), onfocus (Script [p.26])	
area&	onblur (Script [p.26]), onfocus (Script [p.26])	When the Client-side Image Map Module is also used
frameset&	onload (Script [p.26]), onunload (Script [p.26])	When the Frames Module is also used.
form&	onreset (Script [p.26]), onsubmit (Script [p.26])	When the Basic Forms or Forms Module is used
body&	onload (Script [p.26]), onunload (Script [p.26])	
label&	onblur (Script [p.26]), onfocus (Script [p.26])	When the Forms Module is used
input&	onblur (Script [p.26]), onchange (Script [p.26]), onfocus (Script [p.26]), onselect (Script [p.26])	When the Basic Forms or Forms Module is used
select&	onblur (Script [p.26]), onchange (Script [p.26]), onfocus (Script [p.26])	When the Basic Forms or Forms Module is used
textarea&	onblur (Script [p.26]), onchange (Script [p.26]), onfocus (Script [p.26]), onselect (Script [p.26])	When the Basic Forms or Forms Module is used
button&	onblur (Script [p.26]), onfocus (Script [p.26])	When the Forms Module is used

Implementation: DTD [p.135]

5.15. Metainformation Module

The Metainformation Module defines an element that describes information within the declarative portion of a document (in XHTML within the head element). This module includes the following element:

Elements	Attributes	Minimal Content Model
meta	!18N [p.29] , content* (CDATA [p.22]), http-equiv (NMTOKEN [p.22]), name (NMTOKEN [p.22]), scheme (CDATA [p.22])	EMPTY

When this module is selected, the `meta` element is added to the content model of the `head` element as defined in the Structure Module.

Implementation: DTD [p.137]

5.16. Scripting Module

The Scripting Module defines elements that are used to contain information pertaining to executable scripts or the lack of support for executable scripts. Elements and attributes included in this module are:

Elements	Attributes	Minimal Content Model
noscript	Common [p.29]	(Heading List Block)+
script	charset (Charset [p.23]), defer ("defer"), src (URI [p.26]), type* (ContentType [p.23]), xml:space="preserve"	PCDATA

When this module is used, the `script` and `noscript` elements are added to the Block and Inline content sets of the Text Module. In addition, the `script` element is added to the content model of the `head` element defined in the Structure Module.

Implementation: DTD [p.138]

5.17. Style Sheet Module

The Style Sheet Module defines an element to be used when declaring internal style sheets. The element and attributes defined by this module are:

Elements	Attributes	Minimal Content Model
style	!18N [p.29] , media (MediaDesc [p.25]), title (Text [p.26]), type* (ContentType [p.23]), xml:space="preserve"	PCDATA

When this module is used, it adds the `style` element to the content model of the `head` element of the Structure Module.

Implementation: DTD [p.139]

5.18. Style Attribute Module

The Style Attribute Module defines the `style` attribute. When this module is selected, it activates the Style Attribute Collection [p.29] .

Implementation: DTD [p.140]

5.19. Link Module

The Link Module defines an element that can be used to define links to external resources. These resources are often used to augment the user agent's ability to process the associated XHTML document. The element and attributes included in this module are:

Elements	Attributes	Minimal Content Model
link	Common [p.29] , charset (Charset [p.23]), href (URI [p.26]), hreflang (LanguageCode [p.23]), media (MediaDesc [p.25]), rel (LinkTypes [p.24]), rev (LinkTypes [p.24]), type (ContentType [p.23])	EMPTY

When this module is used, it adds the `link` element to the content model of the `head` element as defined in the Structure Module.

Implementation: DTD [p.141]

5.20. Base Module

The Base Module defines an element that can be used to define a base URI against which relative URIs in the document will be resolved. The element and attribute included in this module are:

Elements	Attributes	Minimal Content Model
base	href* (URI [p.26])	EMPTY

When this module is used, it adds the `base` element to the content model of the `head` element of the Structure Module.

Implementation: DTD [p.142]

5.21. Name Identification Module

This module is deprecated.

The Name Identification Module defines the attribute `name` for a collection of elements. The `name` attribute was used historically to identify certain elements within HTML documents. While the `name` attribute has been supplanted by the `id` attribute in all of these elements, there may be instances where markup languages will wish to support both. Such markup languages may do so by including this module.

Note that by including this module, both the `name` and `id` attributes are defined for the elements indicated. In this situation, if the `name` attribute is defined for an element, the `id` attribute must also be defined. Further, these attributes must both have the same value. Finally, when documents that use this attribute are served as Internet Media Type "text/xml" or "application/xml", the value of the `name` attribute on these elements shall not be used as a fragment identifier.

Elements	Attributes	Notes
a&	name (CDATA [p.22])	
applet&	name (CDATA [p.22])	When the Applet Module is selected.
form&	name (CDATA [p.22])	When the Forms or Basic Forms Module is selected.
frame&	name (CDATA [p.22])	When the Frames Module is selected.
iframe&	name (CDATA [p.22])	When the Iframe Module is selected.
img&	name (CDATA [p.22])	When the Image Module is selected.
map&	name (CDATA [p.22])	When the Client-side Image Map Module is selected.

Implementation: DTD [p.143]

5.22. Legacy Module

The Legacy Module defines elements and attributes that were already deprecated in previous versions of HTML and XHTML, and remain deprecated in XHTML Modularization. Markup language authors should no longer use these elements and attributes.

The following table defines the elements and attributes that are defined when the Legacy Module is selected.

Elements	Attributes	Minimal Content Model
basefont	color (Color [p.23]), face (CDATA [p.22]), id (ID [p.22]), size (CDATA [p.22])	EMPTY
center	Common [p.29]	(PCDATA Flow)*
dir	Common [p.29] , compact ("compact")	(li)+
font	Core [p.29] , I18N [p.29] , color (Color [p.23]), face (CDATA [p.22]), size (CDATA [p.22])	(PCDATA Inline)*
isindex	Core [p.29] , I18N [p.29] , prompt (Text [p.26])	EMPTY
menu	Common [p.29] , compact ("compact")	(li)+
s	Common [p.29]	(PCDATA Inline)*
strike	Common [p.29]	(PCDATA Inline)*
u	Common [p.29]	(PCDATA Inline)*

The following table shows additional attributes for elements defined elsewhere when the Legacy module is selected.

Elements	Attributes	Notes
body&	alink (Color [p.23]), background (URI [p.26]), bgcolor (Color [p.23]), link (Color [p.23]), text (Color [p.23]), vlink (Color [p.23])	
br&	clear ("left" "all" "right" "none"*)	
caption&	align ("top" "bottom" "left" "right")	
div&	align ("left" "center" "right" "justify")	
dl&	compact ("compact"), type (CDATA [p.22])	
h1-h6&	align ("left" "center" "right" "justify")	
hr&	align ("left" "center" "right" "justify"), noshade ("noshade"), size (Pixels [p.26]), width (Length [p.23]),	
img&	align ("left" "center" "right" "justify"), border (Pixels [p.26]), hspace (Pixels [p.26]), vspace (Pixels [p.26])	
input&	align ("top" "middle" "bottom" "left" "right")	When the Basic Forms or Forms Module is selected.

Elements	Attributes	Notes
legend&	align ("left" "center" "right" "justify")	When the Forms Module is selected.
li&	type (CDATA [p.22]), value (Number [p.26])	
ol&	compact ("compact"), start (Number [p.26]), type (CDATA [p.22])	
p&	align ("left" "center" "right", "justify")	
pre&	width (Number [p.26])	
script&	language (CDATA [p.22])	When the Scripting module is selected.
table&	align ("left" "center" "right"), bgcolor (Color [p.23])	When the Tables module is selected.
tr&	bgcolor (Color [p.23])	When the Tables module is selected.
th&	bgcolor (Color [p.23]), height (Pixels [p.26]) nowrap ("nowrap"), width (Length [p.23])	When the Tables module is selected.
td&	bgcolor (Color [p.23]), height (Length [p.23]) nowrap ("nowrap"), width (Pixels [p.26])	When the Tables module is selected.
ul&	compact ("compact"), type (CDATA [p.22])	

Implementation: DTD [p.145]

A. Building Schema Modules

This appendix is *normative*.

This appendix will contain instructions on how to define XML Schema modules that are compatible with the XHTML Modularization implementation via XML Schema [XMLSCHEMA] [p.170] when XML Schema becomes a W3C Recommendation.

B. Developing Schema with defined and extended modules

This appendix is *normative*.

This appendix will contain instructions on how to define entire markup languages using XHTML modules via XML Schema [XMLSCHEMA] [p.170] when XML Schema becomes a W3C Recommendation.

C. XHTML Schema Module Implementations

This appendix is *normative*.

This appendix will contain implementations of the modules defined in XHTML Abstract Modules [p.29] via XML Schema [XMLSCHEMA] [p.170] when XML Schema becomes a W3C Recommendation.

D. Building DTD Modules

This section is *normative*.

XHTML modules are implemented as DTD fragments. When these fragments are assembled in a specific manner (described in Developing DTDs with defined and extended modules [p.65]), the resulting DTD is a representation of a complete document type. This representation can then be used for validation of instances of the document type.

The key to combining these fragments into a meaningful DTD is the rules used to define the fragments. This section defines those rules. When these rules are followed, DTD authors can be confident that their modules will interface cleanly with other XHTML-compatible modules.

Modules conforming to these rules also need to satisfy the conformance requirements defined in XHTML Family Module Conformance [p.16] in order to be called *XHTML Family Modules*.

D.1. Parameter Entity Naming

This specification classifies parameter entities into seven categories and names them consistently using the following suffixes:

`.mod`

parameter entities use the suffix `.mod` when they are used to represent a DTD module (a collection of elements, attributes, parameter entities, etc). In this specification, each module is an atomic unit and may be represented as a separate file entity.

`.module`

parameter entities use the suffix `.module` when they are used to control the inclusion of a DTD module by containing either of the conditional section keywords `INCLUDE` or `IGNORE`.

`.qname`

parameter entities use the suffix `.qname` when they are used to represent the qualified name of an element. See Defining the Namespace of a Module [p.58] for more information on qualified names.

`.content`

parameter entities use the suffix `.content` when they are used to represent the content model of an element type.

`.class`

parameter entities use the suffix `.class` when they are used to represent elements of the same class.

`.mix`

parameter entities use the suffix `.mix` when they are used to represent a collection of element types from different classes.

`.attrib`

parameter entities use the suffix `.attrib` when they are used to represent a group of tokens representing one or more complete attribute specifications within an `ATTLIST` declaration.

For example, in HTML 4, the `%block;` parameter entity is defined to represent the heterogeneous collection of element types that are block-level elements. In this specification, the corollary parameter entity is `%Block.mix;`.

When defining parameter entities in the classes defined here, modules should scope the names of the entities by using unique prefixes. For example, the content model for the element `myelement` in the module `mymodule` could be named `MYMODULE.myelement.content`. Other schemes are possible. Regardless of the scheme used, module authors should strive to ensure that parameter entities they define are named uniquely so that they do not collide with other parameter entities and so that the interface methods for the module are obvious to its users.

D.2. Defining the Namespace of a Module

XHTML requires that the elements and attributes declared in a module be within a defined XML namespace [XMLNAMES] [p.170]. The identification of this namespace is an arbitrary URI. XHTML requires that when a module is implemented using an XML DTD, the module declares the namespace in a special manner. The purpose of this is to permit the selection, at document parse/validation time, of the use of namespace prefixes and of the *prefix* that is used to identify elements and attributes from the module.

Content developers who wish to develop documents based upon hybrid document types may choose to use XML namespace prefixes on elements from the XHTML namespace, on elements from other namespaces, or on both. In order to ensure that such documents are XHTML conforming and backward compatible with non-namespace aware tools, the W3C recommends that content developers *do not* use XML namespace prefixes on elements from the XHTML namespace. When content developers are interested in having their content processed by namespace-aware processors, the W3C further recommends that elements in non-XHTML namespaces be specified using an XML namespace prefix rather than relying upon XML namespace defaulting mechanisms.

Each XHTML-conforming module implemented as an XML DTD is required to define a default XML namespace prefix, a method for changing this prefix within a document instance, and a marked section that turns on the processing of the prefix.

Note that it is legal and expected for multiple modules to be part of the same namespace when they are related. All of the XHTML modules, for example, are part of the same namespace.

D.2.1. Qualified Names sub-module

First, you need to define a qualified names sub-module (a sub-module is just a *file entity* that is separated so that it can be incorporated into the ultimate DTD at the appropriate point). The qualified names sub-module is built using the following steps (where the string `MODULE` is replaced with an appropriate string for the new module):

1. Define a parameter entity `MODULE.prefixed` that announces whether the elements in the module are being used with XML namespace prefixed names or not. This parameter entity's default value should be `"%NS.prefixed;"`. The `NS.prefixed` parameter entity is defined by the XHTML framework to be `IGNORE` by default, and can be used in a document instance to switch on prefixing for all included namespaces (including that of the XHTML modules).
2. Define a parameter entity `MODULE.xmlns` that contains the namespace identifier for this module.
3. Define a parameter entity `MODULE.prefix` that contains the default prefix string to use when prefixing is enabled.
4. Define a parameter entity `MODULE.pfx` that is `"%MODULE.prefix;"` when prefixing is enabled, and `""` when it is not.
5. Define a parameter entity `MODULE.xmlns.extra.attrib` that contains the declaration of any XML namespace attributes for namespaces referenced by this module (e.g., `xmlns:xlink`). When `%MODULE.prefixed` is set to `INCLUDE`, this attribute should include the `xmlns:%MODULE.prefix;` declaration as well.
6. Define a parameter entity `XHTML.xmlns.extra.attrib` as `MODULE.xmlns.extra.attrib`. This is usually overridden by the document type's driver file, but if not this definition will take over as the default.
7. For each of the elements defined by the module, create a parameter entity of the form `"MODULE.NAME.qname"` to hold its qualified name. The value for this parameter entity must be `"%MODULE.pfx;NAME"`. In this way, the parsed value will be `"PREFIX:NAME"` when prefixes are enabled, and `"NAME"` otherwise.

If the module adds attributes to elements defined in modules that do not share the namespace of this module, declare those attributes so that they use the `%MODULE.pfx` prefix. For example:

```
<ENTITY % MODULE.img.myattr.qname "%MODULE.pfx;myattr" >
```

An example of a `qname` sub-module for a hypothetical Inventory Module is included below:

```
<!-- ..... -->
<!-- Inventory Qname Module ..... -->
<!-- file: inventory-qname-1.mod

PUBLIC "-//MY COMPANY//ELEMENTS XHTML Inventory Qnames 1.0//EN"
SYSTEM "http://www.example.com/DTDs/inventory-qname-1.mod"

xmlns:inventory="http://www.example.com/xmlns/inventory"
..... -->

<!-- Declare the default value for prefixing of this module's elements -->
<!-- Note that the NS.prefixed will get overridden by the XHTML Framework or
by a document instance. -->
<ENTITY % NS.prefixed "IGNORE" >
<ENTITY % Inventory.prefixed "%NS.prefixed;" >

<!-- Declare the actual namespace of this module -->
<ENTITY % Inventory.xmlns "http://www.example.com/xmlns/inventory" >

<!-- Declare the default prefix for this module -->
```

```

<!ENTITY % Inventory.prefix "inventory" >

<!-- Declare the prefix for this module -->
<![%Inventory.prefixed;[
<!ENTITY % Inventory.pfx "%Inventory.prefix;:" >
]]>
<!ENTITY % Inventory.pfx "" >

<!-- Declare the xml namespace attribute for this module -->
<![%Inventory.prefixed;[
<!ENTITY % Inventory.xmlns.extra.attrib
    "xmlns:%Inventory.prefix;    %URI.datatype; #FIXED '%Inventory.xmlns;'" >
]]>
<!ENTITY % Inventory.xmlns.extra.attrib "" >

<!-- Declare the extra namespace that should be included in the XHTML
    elements -->
<!ENTITY % XHTML.xmlns.extra.attrib
    %Inventory.xmlns.extra.attrib; >

<!-- Now declare the qualified names for all of the elements in the
    module -->
<!ENTITY % Inventory.shelf.qname "%Inventory.pfx;shelf" >
<!ENTITY % Inventory.item.qname "%Inventory.pfx;item" >
<!ENTITY % Inventory.desc.qname "%Inventory.pfx;desc" >
<!ENTITY % Inventory.sku.qname "%Inventory.pfx;sku" >
<!ENTITY % Inventory.price.qname "%Inventory.pfx;price" >

```

D.2.2. Declaration sub-module(s)

Next, you need to define one or more "declaration sub-modules". The purpose of these *file entities* is to declare the XML DTD elements and attribute lists. An XHTML declaration module should be constructed using the following process:

1. Define a parameter entity to use within the ATTLIST of each declared element. This parameter entity should contain %NS.decl.attrib; when %MODULE.prefixed; is set to INCLUDE, and %NS.decl.attrib; plus "xmlns %URI.datatype; #FIXED '%MODULE.xmlns;'" when %MODULE.prefixed; is set to IGNORE.
2. Declare all of the elements and attributes for the module. Within each ATTLIST for an element, include the parameter entity defined above so that all of the required xmlns attributes are available on each element in the module.
3. If the module adds attributes to elements defined in modules that do not share the namespace of this module, declare those attributes so that they use the %MODULE.pfx prefix. For example:

```

<ENTITY % MODULE.img.myattr.qname "%MODULE.pfx;myattr" >
<ATTLIST %img.qname;
    %MODULE.img.myattr.qname;    CDATA        #IMPLIED
>

```

This would add an attribute to the `img` element of the Image Module, but the attribute's name will be the qualified name, including prefix, when prefixes are selected for a document instance. It also adds the `xmlns:MODULE_PREFIX` attribute to the `img` element's attribute list so that an XML Namespace-aware parser would know how to resolve the namespace based upon its prefix.

The following example shows a declaration sub-module for a hypothetical Inventory module.

```
<!-- ..... -->
<!-- Inventory Elements Module ..... -->
<!-- file: inventory-1.mod

PUBLIC "-//MY COMPANY//ELEMENTS XHTML Inventory Elements 1.0//EN"
SYSTEM "http://www.example.com/DTDs/inventory-1.mod"

xmlns:inventory="http://www.example.com/xmlns/inventory"
..... -->

<!-- Inventory Module

shelf
  item
  sku
  desc
  price

This module defines a simple inventory item structure
-->

<!-- Define the global namespace attributes -->
<![%Inventory.prefixed;[
<!ENTITY % Inventory.xmlns.attrib
  "%NS.decl.attrib;"
>
]]>
<!ENTITY % Inventory.xmlns.attrib
  "xmlns %URI.datatype; #FIXED '%Inventory.xmlns;'"
>

<!-- Define a common set of attributes for all module elements -->
<!ENTITY % Inventory.Common.attrib
  "%Inventory.xmlns.attrib;
  id ID #IMPLIED
>

<!-- Define the elements and attributes of the module -->
<!ELEMENT %Inventory.shelf.qname;
  ( %Inventory.item.qname; )* >
<!ATTLIST %Inventory.shelf.qname;
  location CDATA #IMPLIED
  %Inventory.Common.attrib;
>
<!ELEMENT %Inventory.item.qname;
  ( %Inventory.desc.qname;, %Inventory.sku.qname;, %Inventory.price.qname; ) >
<!ATTLIST %Inventory.item.qname;
  location CDATA #IMPLIED
  %Inventory.Common.attrib;
```

```

>
<!ELEMENT %Inventory.desc.qname; ( #PCDATA ) >
<!ATTLIST %Inventory.desc.qname;
    %Inventory.Common.attrib;
>

<!ELEMENT %Inventory.skus.qname; ( #PCDATA ) >
<!ATTLIST %Inventory.skus.qname;
    %Inventory.Common.attrib;
>

<!ELEMENT %Inventory.price.qname; ( #PCDATA ) >
<!ATTLIST %Inventory.price.qname;
    %Inventory.Common.attrib;
>

<!-- end of inventory-1.mod -->

```

D.2.3. Using the module as a stand-alone DTD

It is sometimes desirable to have an XHTML module also usable as a stand alone DTD. A good example of this is our Inventory module above. These items need to be embeddable in an XHTML document, and also need to be available as free-standing documents extracted from a database (for example). The easiest way to accomplish this is to define a DTD file that instantiates the components of your module. Such a DTD would have this structure:

1. Include the XHTML Datatypes Module (your qnames module likely uses some of these datatypes - it certainly uses the URI datatype for the xmlns attribute).
2. Include the Qnames Module for your module.
3. Define the parameter entity NS.decl.attrib to be %MODULE.xmlns.extra.attrib;.
4. Include the Declaration Module(s) for your module.

An example of this for our Inventory module is included below:

```

<!-- ..... -->
<!-- Inventory Elements DTD ..... -->
<!-- file: inventory-1.dtd

PUBLIC "-//MY COMPANY//DTD XHTML Inventory 1.0//EN"
SYSTEM "http://www.example.com/DTDs/inventory-1.dtd"

xmlns:inventory="http://www.example.com/xmlns/inventory"
..... -->

<!-- Inventory Module

shelf
    item
    sku
    desc
    price

This module defines a simple inventory item structure

```

```

-->

<!-- Bring in the datatypes -->
<!ENTITY % xhtml-datatypes.mod
    PUBLIC "-//W3C//ENTITIES XHTML Datatypes 1.0//EN"
    "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-datatypes-1.mod" >
%xhtml-datatypes.mod;

<!-- Bring in the qualified names -->
<!ENTITY % Inventory-qname.mod SYSTEM "inventory-qname-1.mod" >
%Inventory-qname.mod;

<!ENTITY % NS.decl.attrib "%Inventory.xmlns.extra.attrib;">

<!ENTITY % Inventory.mod SYSTEM "inventory-1.mod" >
%Inventory.mod;

<!-- end of inventory-1.dtd -->

```

This DTD can then be referenced by documents that use only the elements from your module:

```

<!DOCTYPE shelf SYSTEM "inventory-1.dtd">
<shelf xmlns="http://www.example.com/xmlns/inventory">
  <item>
    <desc>
      this is a description.
    </desc>
    <sku>
      this is the price.
    </sku>
    <price>
      this is the price.
    </price>
  </item>
</shelf>

```

This method permits the definition of elements and attributes that are scoped within their own namespace. It also permits content developers to use the default prefix for the elements and attributes:

```

<!DOCTYPE inventory:shelf SYSTEM "inventory-1.dtd" [
  <!ENTITY % Inventory.prefixes "INCLUDE">
]>
<inventory:shelf xmlns:inventory="http://www.example.com/xmlns/inventory">
  <inventory:item>
    <inventory:desc>
      this is a description.
    </inventory:desc>
    <inventory:sku>
      this is the sku.
    </inventory:sku>
    <inventory:price>
      this is the price.
    </inventory:price>
  </inventory:item>
</inventory:shelf>

```

Finally, a document instance can use a different XML namespace prefix by redeclaring it in the DOCTYPE header and its internal subset:

```
<!DOCTYPE i:shelf SYSTEM "inventory-1.dtd" [
  <!ENTITY % Inventory.prefixes "INCLUDE">
  <!ENTITY % Inventory.prefix "i">
]>
<i:shelf xmlns:i="http://www.example.com/xmlns/inventory">
  <i:item>
    <i:desc>
      this is a description.
    </i:desc>
    <i:sku>
      this is the price.
    </i:sku>
    <i:price>
      this is the price.
    </i:price>
  </i:item>
</i:shelf>
```

D.2.4. Namespace Idiosyncrasies

While the approach defined here permits the definition of markup languages that are XML and XML namespaces conforming, some behaviors defined by the XML namespaces specification are not supported:

1. XML namespaces permit the redeclaration of the xmlns attribute for a namespace at any point in the tree. It further permits this redeclaration to switch between namespace defaulting and prefixed usage, and permits the changing of the prefix. The method defined in this document does not permit this. Throughout a document instance a given namespace must continue to use the same namespace prefix (when prefixing is used), or must continue to be used in the default scope.
2. When using XML namespace defaulting, it is legal to rely upon the DTD of the document to inform parsers of the namespace of elements. However, since namespace aware processors are not required to include the DTD when evaluating a document, content developers should declare the XML namespace of an element whenever the namespace changes:

```
...
<p>
  <myelement xmlns="..." />
</p>
```

E. Developing DTDs with defined and extended modules

This section is **informative**.

The primary purpose of defining XHTML modules and a general modularization methodology is to ease the development of document types that are based upon XHTML. These document types may extend XHTML by integrating additional capabilities (e.g., [SMIL] [p.171]), or they may define a subset of XHTML for use in a specialized device. This section describes the techniques that document type designers must use in order to take advantage of the XML DTD implementation of this modularization architecture. It does this by applying the XHTML Modularization techniques in progressively more complex ways, culminating in the creation of a complete document type from disparate modules.

Note that in no case do these examples require the modification of the XHTML-provided module *file entities* themselves. The XHTML module file entities are completely parameterized, so that it is possible through separate module definitions and *driver files* to customize the definition and the content model of each element and each element's hierarchy.

Finally, remember that most users of XHTML are *not* expected to be DTD authors. DTD authors are generally people who are defining specialized markup that will improve the readability, simplify the rendering of a document, or ease machine-processing of documents, or they are client designers that need to define the specialized DTD for their specific client. Consider these cases:

- An organization is providing subscriber's information via a Web interface. The organization stores its subscriber information in an XML-based database. One way to report that information out from the database to the Web is to embed the XML records from the database directly in the XHTML document. While it is possible to merely embed the records, the organization could define a DTD module that describes the records, attach that module to an XHTML DTD, and thereby create a complete DTD for the pages. The organization can then access the data within the new elements via the Document Object Model [DOM] [p.169] , validate the documents, provide style definitions for the elements that cascade using Cascading Style Sheets [CSS2] [p.169] , etc. By taking the time to define the structure of their data and create a DTD using the processes defined in this section, the organization can realize the full benefits of XML.
- An Internet client developer is designing a specialized device. That device will only support a subset of XHTML, and the devices will always access the Internet via a proxy server that validates content before passing it on to the client (to minimize error handling on the client). In order to ensure that the content is valid, the developer creates a DTD that is a subset of XHTML using the processes defined in this section. They then use the new DTD in their proxy server and in their devices, and also make the DTD available to content developers so that developers can validate their content before making it available. By performing a few simple steps, the client developer can use the architecture defined in this document to greatly ease their DTD development cost *and* ensure that they are fully supporting the

subset of XHTML that they choose to include.

E.1. Defining additional attributes

In some cases, an extension to XHTML can be as simple as additional attributes. Attributes can be added to an element just by specifying an additional ATTLIST for the element, for example:

```
<!ATTLIST %a.qname;
    %MyModule.pfx;myattr    CDATA        #IMPLIED
    %MyModule.xmlns.extras.attrib;
>
```

would add the "myattr" attribute, with an optional prefix defined by "%MyModule.pfx", with a value type of CDATA, to the "a" element. This works because XML permits the definition or extension of the attribute list for an element at any point in a DTD. *For a discussion of qualified names and namespace prefixes, see Defining the Namespace of a Module [p.58].*

Naturally, adding an attribute to a DTD does not mean that any new behavior is defined for arbitrary clients. However, a content developer could use an extra attribute to store information that is accessed by associated scripts via the Document Object Model (for example).

E.2. Defining additional elements

Defining additional elements is only slightly more complicated than defining additional attributes. Basically, DTD authors should write the element declaration for each element:

```
<!-- In the qname sub-module -->
<!ENTITY % MyModule.myelement.qname    "%MyModule.pfx;myelement" >
<!ENTITY % MyModule.myotherelement.qname "%MyModule.pfx;myotherelement" >

<!-- In the declaration sub-module -->
<!ELEMENT %MyModule.myelement.qname;
    ( #PCDATA | %MyModule.myotherelement.qname; )* >
<!ATTLIST %MyModule.myelement.qname;
    myattribute    CDATA    #IMPLIED
>

<!ELEMENT %MyModule.myotherelement.qname; EMPTY >
```

After the elements are defined, they need to be integrated into the content model. Strategies for integrating new elements or sets of elements into the content model are addressed in the next section.

E.3. Defining the content model for a collection of modules

Since the content model of XHTML modules is fully parameterized, DTD authors may modify the content model for every element in every module. The details of the DTD module interface are defined in Building DTD Modules [p.57]. Basically there are two ways to approach this modification:

1. Re-define the ".content" parameter entity for each element.
2. Re-define one or more of the global content model entities (normally via the ".extras" parameter entity).

The strategy taken will depend upon the nature of the modules being combined and the nature of the elements being integrated. The remainder of this section describes techniques for integrating two different classes of modules.

E.3.1. Integrating a stand-alone module into XHTML

When a module (and remember, a module can be a collection of other modules) contains elements that only reference each other in their content model, it is said to be "internally complete". As such, the module can be used on its own; (for example, you could define a DTD that was just that module, and use one of its elements as the root element). Integrating such a module into XHTML is a three step process:

1. Decide what element(s) can be thought of as the root(s) of the new module.
2. Decide where these elements need to attach in the XHTML content tree.
3. Then, for each attachment point in the content tree, add the root element(s) to the content definition for the XHTML elements.

Consider attaching the elements defined above [p.66] . In that example, the element `myelement` is the root. To attach this element under the `img` element, and only the `img` element, of XHTML, the following would work:

```
<!ENTITY % img.content "( %MyModule.myelement.qname; ) * ">
```

A DTD defined with this content model would allow a document like the following fragment:

```

<myml:myelement >This is content of a locally defined element</myml:myelement>
</img>
```

It is important to note that normally the `img` element has a content model of `EMPTY`. By adding `myelement` to that content model, we are really just replacing `EMPTY` with `myelement`. In the case of other elements that already have content models defined, the addition of an element would require the restating of the existing content model in addition to `myelement`.

E.3.2. Mixing a new module throughout the modules in XHTML

Extending the example above, to attach this module everywhere that the `%Flow.mix` content model group is permitted, would require something like the following:

```
<!ENTITY % Misc.extra
" | %MyModule.myelement.qname; " >
```

Since the %Misc.extra content model class is used in the %Misc.class parameter entity, and that parameter entity is used throughout the XHTML modules, the new module would become available throughout an extended XHTML document type.

E.4. Creating a new DTD

So far the examples in this section have described the methods of extending XHTML and XHTML's content model. Once this is done, the next step is to collect the modules that comprise the DTD into a single DTD driver, incorporating the new definitions so that they override and augment the basic XHTML definitions as appropriate.

E.4.1. Creating a simple DTD

Using the trivial example above, it is possible to define a new DTD that uses and extends the XHTML modules pretty easily. First, define the new elements and their content model in a module:

```
<!-- File: simpleml-model-1.mod -->

<!-- Declare a Parameter Entity (PE) that defines any external namespaces
      that are used by this module -->

<!-- Set the PE that is used in every ATTLIST in this module
      NS.prefixed.attrib is initialized in the xhtml-qname module, and
      SimpleML.ns.noprefix.attrib is initialized in the SimpleML DTD driver
      file.-->
<!ENTITY % SimpleML.xmlns.attrib
      "%NS.decl.attrib;"
>

<!ENTITY % SimpleML.Common.attrib
      "%SimpleML.xmlns.attrib;
      id          ID          #IMPLIED"
>

<!ENTITY % SimpleML.element.qname "%SimpleML.pfx;element" >
<!ENTITY % SimpleML.otherelement.qname "%SimpleML.pfx;otherelement" >

<!ELEMENT %SimpleML.element.qname;
      ( #PCDATA | %SimpleML.otherelement.qname; )* >
<!ATTLIST %SimpleML.element.qname;
      myattribute  CDATA #IMPLIED
      %SimpleML.Common.attrib;
>

<!ELEMENT %SimpleML.otherelement.qname; EMPTY >
<!ATTLIST %SimpleML.otherelement.qname;
      %SimpleML.Common.attrib;
>

<!ENTITY % SimpleML.img.myattr.qname "%SimpleML.pfx;myattr" >
<!ATTLIST %img.qname;
      %SimpleML.img.myattr.qname;  CDATA #IMPLIED
>
```

```

<!-- Add our elements to the XHTML content model -->
<!ENTITY % Misc.class
    "| %SimpleML.element.qname;" >

<!-- Now bring in the XHTML Basic content model -->
<!ENTITY % xhtml-basic-model.mod
    PUBLIC "-//W3C//ENTITIES XHTML Basic 1.0 Document Model 1.0//EN"
        "http://www.w3.org/TR/xhtml-basic/xhtml-basic10-model-1.mod" >
%xhtml-basic-model.mod;

```

Next, define the DTD driver for the new language:

```

<!-- file: simpleml-1_0.dtd -->

<!-- Bring in the XHTML datatypes -->
<!ENTITY % xhtml-datatypes.mod
    PUBLIC "-//W3C//ENTITIES XHTML Datatypes 1.0//EN"
        "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-datatypes-1.mod" >
%xhtml-datatypes.mod;

<!-- Declare the actual namespace of this module -->
<!ENTITY % SimpleML.xmlns "http://www.example.com/xmlns/simpleml1" >

<!-- By default, disable prefixing of new module -->
<!ENTITY % NS.prefix "IGNORE" >
<!ENTITY % SimpleML.prefix "%NS.prefix;" >

<!-- Default prefix for module elements and attributes -->
<!ENTITY % SimpleML.prefix "simpleml" >

<!-- If this module's namespace is prefixed -->
<![%SimpleML.prefix;[
    <!ENTITY % SimpleML.pfx "%SimpleML.prefix;" >
]]>
<!ENTITY % SimpleML.pfx "" >

<![%SimpleML.prefix;[
    <!ENTITY % SimpleML.xmlns.extra.attrib
        "xmlns:%SimpleML.prefix; %URI.datatype; #FIXED '%SimpleML.xmlns;' " >
]]>
<!ENTITY % SimpleML.xmlns.extra.attrib "" >

<!ENTITY % XHTML.xmlns.extra.attrib
    "%SimpleML.xmlns.extra.attrib;"
>

<!-- Set the content model for our language -->
<!ENTITY % xhtml-model.mod
    SYSTEM "simpleml-model-1.mod" >
<!-- Instantiate xhtml basic's DTD to do all the work -->
<!ENTITY % xhtml-basic.dtd
    PUBLIC "-//W3C//DTD XHTML Basic 1.0//EN"
        "http://www.w3.org/TR/xhtml-basic/xhtml-basic10.dtd" >
%xhtml-basic.dtd;

```

When using this DTD, it is possible to enable the use of XML namespace prefixes. When so doing, the start of a document using this new DTD might look like:

```
<!DOCTYPE html SYSTEM "simpleml-1_0.dtd" [
  <!ENTITY % SimpleML.prefixed "INCLUDE">
]>
<html xmlns="http://www.w3.org/1999/xhtml"
      xmlns:simpleml="http://www.example.com/xmlns/simpleml1" >
<head>
<title>An example using defaults</title>
</head>
<body>
<p>This is content in the XHTML namespace</p>
<simpleml:element>
  This is content in the SimpleML namespace.
  <simpleml:otherelement />
</simpleml:element>
<p></p>
</body>
</html>
```

E.4.2. Creating a DTD by extending XHTML

Next, there is the situation where a complete, additional, and complex module is added to XHTML (or to a subset of XHTML). In essence, this is the same as in the trivial example above, the only difference being that the module being added is incorporated in the DTD by reference rather than explicitly including the new definitions in the DTD.

One such complex module is the DTD for [MATHML] [p.170] . In order to combine MathML and XHTML into a single DTD, an author would just decide where MathML content should be legal in the document, and add the MathML root element to the content model at that point. First, define a content model module that instantiates the MathML DTD and connects it to the content model:

```
<!-- File: mathml-model.mod -->
<!ENTITY % XHTML1-math
  PUBLIC "-//W3C//DTD MathML 2.0//EN"
  "http://www.w3.org/TR/MathML2/dtd/mathml2.dtd" >
%XHTML1-math;

<!ENTITY % Inlspecial.extra
  "%a.qname; | %img.qname; | %object.qname; | %map.qname;
  | %Mathml.Math.qname;" >
```

Next, define a DTD driver that identifies our new content model module as the content model for the DTD, and hands off processing to the XHTML 1.1 driver (for example):

```
<!-- File: xhtml-mathml.dtd -->
<!ENTITY % xhtml-model.mod
  SYSTEM "mathml-model.mod" >
<!ENTITY % xhtml11.dtd
  PUBLIC "-//W3C//DTD XHTML 1.1//EN"
  "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd" >
%xhtml11.dtd;
```

E.4.3. Creating a DTD by removing and replacing XHTML modules

Another way in which DTD authors may use XHTML modules is to define a DTD that is a subset of an XHTML family document type (because, for example, they are building devices or software that only supports a subset of XHTML). Doing this is only slightly more complex than the previous example. The basic steps to follow are:

1. Take an XHTML family DTD as the basis of the new document type (we will use XHTML 1.1).
2. Select the modules to remove from that DTD.
3. Define a new DTD that "IGNOREs" the modules.
4. Introduce some new modules.

For example, consider a device that uses XHTML modules, but without forms or tables. The DTD for such a device would look like this:

```
<!-- File: xhtml-simple.dtd -->
<!ENTITY % xhtml-form.module "IGNORE" >
<!ENTITY % xhtml-table.module "IGNORE" >
<!ENTITY % xhtml-table.module "IGNORE" >
<!-- Bring in the basic tables module -->
<!ENTITY % xhtml-basic-table.mod
    PUBLIC "-//W3C//ELEMENTS XHTML Basic Tables 1.0//EN"
        "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-basic-table-1.mod"
    >
%xhtml-basic-table.mod;
<!ENTITY % xhtml11.mod
    PUBLIC "-//W3C//DTD XHTML 1.1//EN"
        "http://www.w3.org/TR/xhtml11/DTD/xhtml11.dtd" >
%xhtml11.mod;
```

Note that this does not actually modify the content model for the XHTML 1.1 DTD. However, since XML ignores elements in content models that are not defined, the form and table elements are dropped from the model automatically.

E.4.4. Creating a new DTD

Finally, some DTD authors may wish to start from scratch, using the XHTML Modularization framework as a toolkit for building a new markup language. This language must be made up of the minimal, required modules from XHTML. It may also contain other XHTML-defined modules or any other module that the author wishes to employ. In this example, we will take the XHTML required modules, add some XHTML-defined modules, and also add in the module we defined above.

The first step is to use the XHTML-provided template for a new qualified names module, modified to define the qualified names and namespace for our new elements.

```

<!-- file: myml-qname-1.mod -->

<!-- Bring in the datatypes - we use the URI.datatype PE for declaring the
      xmlns attributes. -->
<!ENTITY % MyML-datatypes.mod
      PUBLIC "-//W3C//ENTITIES XHTML Datatypes 1.0//EN"
      "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-datatypes-1.mod" >
%MyML-datatypes.mod;

<!-- By default, disable prefixing of this module -->
<!ENTITY % NS.prefixed "IGNORE" >
<!ENTITY % MyML.prefixed "%NS.prefixed;" >

<!-- Declare the actual namespace of this module -->
<!ENTITY % MyML.xmlns "http://www.example.com/xmlns/myml" >

<!-- Declare the default prefix for this module -->
<!ENTITY % MyML.prefix "myml" >

<!-- If this module's namespace is prefixed -->
<![%MyML.prefixed;[
  <!ENTITY % MyML.pfx "%MyML.prefix;:" >
]]>
<!ENTITY % MyML.pfx "" >

<!-- Declare a Parameter Entity (PE) that defines any external namespaces
      that are used by this module -->
<!ENTITY % MyML.xmlns.extra.attrib "" >

<!-- Declare a PE that defines the xmlns attributes for use by MyML. -->
<![%MyML.prefixed;[
<!ENTITY % MyML.xmlns.attrib
  "xmlns:%MyML.prefix; %URI.datatype; #FIXED '%MyML.xmlns;'
  %MyML.xmlns.extra.attrib;"
>
]]>
<!ENTITY % MyML.xmlns.attrib
  "xmlns %URI.datatype; #FIXED '%MyML.xmlns;'
  %MyML.xmlns.extra.attrib;"
>

<!-- Make sure that the MyML namespace attributes are included on the XHTML
      attribute set -->
<![%NS.prefixed;[
<!ENTITY % XHTML.xmlns.extra.attrib
  "%MyML.xmlns.attrib;" >
]]>
<!ENTITY % XHTML.xmlns.extra.attrib
  ""
>
<!-- Now declare the element names -->

<!ENTITY % MyML.myelement.qname "%MyML.pfx;myelement" >
<!ENTITY % MyML.myotherelement.qname "%MyML.pfx;myotherelement" >

```

Next, define a module that defines the elements and attributes using the XHTML provided template.

```

<!-- ..... -->
<!-- My Elements Module ..... -->
<!-- file: myml-elements-1_0.mod

PUBLIC "-//MY COMPANY//ELEMENTS XHTML MyML Elements 1.0//EN"
SYSTEM "http://example.com/DTDs/myml-elements-1_0.mod"

xmlns:myml="http://example.com/DTDs/myml-1_0.dtd"
..... -->

<!-- My Elements Module

myelement
myotherelement

This module has no purpose other than to provide structure for some
PCDATA content.
-->

<!ELEMENT %MyML.myelement.qname;
( #PCDATA | %MyML.myotherelement.qname; )* >
<!ATTLIST %MyML.myelement.qname;
myattribute CDATA #IMPLIED
%MyML.xmlns.attrib;
>

<!ELEMENT %MyML.myotherelement.qname; EMPTY >
<!ATTLIST %MyML.myotherelement.qname;
%MyML.xmlns.attrib;
>

<!ENTITY % MyML.img.myattr.qname "%MyML.pfx;myattr" >
<!ATTLIST %img.qname;
%MyML.img.myattr.qname; CDATA #IMPLIED
%MyML.xmlns.attrib;
>

<!-- end of myml-elements-1_0.mod -->

```

Now, build a content model description that hooks the new elements and attributes into the other XHTML elements. The following example is patterned after the XHTML Basic content model, but is a complete, free-standing content model module:

```

<!-- ..... -->
<!-- MyML Model Module ..... -->
<!-- file: myml-model-1.mod

PUBLIC "-//MY COMPANY//ELEMENTS XHTML MyML Model 1.0//EN"
SYSTEM "http://example.com/DTDs/myml-model-1_0.mod"

xmlns:myml="http://www.example.com/xmlns/myml"
..... -->

```

```

<!-- Define the content model for Misc.extra -->
<!ENTITY % Misc.class
    "| %MyML.myelement.qname; ">

<!-- ..... Inline Elements ..... -->

<!ENTITY % HeadOpts.mix
    "( %meta.qname; )*" >

<!ENTITY % I18n.class "" >

<!ENTITY % InlStruct.class "%br.qname; | %span.qname;" >

<!ENTITY % InlPhras.class
    "| %em.qname; | %strong.qname; | %dfn.qname; | %code.qname;
    | %samp.qname; | %kbd.qname; | %var.qname; | %cite.qname;
    | %abbr.qname; | %acronym.qname; | %q.qname;" >

<!ENTITY % InlPres.class
    "" >

<!ENTITY % Anchor.class "| %a.qname;" >

<!ENTITY % InlSpecial.class "| %img.qname;" >

<!ENTITY % Inline.extra "" >

<!-- %Inline.class; includes all inline elements,
    used as a component in mixes
-->
<!ENTITY % Inline.class
    "%InlStruct.class;
    %InlPhras.class;
    %InlPres.class;
    %Anchor.class;
    %InlSpecial.class;"
>

<!-- %InlNoAnchor.class; includes all non-anchor inlines,
    used as a component in mixes
-->
<!ENTITY % InlNoAnchor.class
    "%InlStruct.class;
    %InlPhras.class;
    %InlPres.class;
    %InlSpecial.class;"
>

<!-- %InlNoAnchor.mix; includes all non-anchor inlines
-->

>

<!-- special content model for pre element -->
<!ENTITY % pre.content
    "( #PCDATA

```

```

    | %Inline.class; )*"
>

<!-- end of myml-model-1.mod -->

```

Finally, use the XHTML-provided template for a new DTD, modified as appropriate for our new markup language:

```

<!-- ..... -->
<!-- MYML DTD ..... -->
<!-- file: myml-1_0.dtd -->

<!-- This is the DTD driver for myml 1.0.

Please use this formal public identifier to identify it:

    "-//MY COMPANY//DTD XHTML MYML 1.0//EN"

And this namespace for myml-unique elements:

    xmlns:myml="http://www.example.com/xmlns/myml"
-->
<!ENTITY % XHTML.version "-//MY COMPANY//DTD XHTML MYML 1.0//EN" >

<!-- reserved for use with document profiles -->
<!ENTITY % XHTML.profile "" >

<!-- Tell the framework to use our qualified names module as an extra qname
driver -->
<!ENTITY % xhtml-qname-extra.mod
SYSTEM "myml-qname-1.mod" >

<!-- Define the Content Model for the framework to use -->
<!ENTITY % xhtml-model.mod
SYSTEM "myml-model-1.mod" >

<!-- Disable bidirectional text support -->
<!ENTITY % XHTML.bidi "IGNORE" >

<!-- Bring in the XHTML Framework -->
<!ENTITY % xhtml-framework.mod
PUBLIC "-//W3C//ENTITIES XHTML Modular Framework 1.0//EN"
"http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-framework-1.mod" >
%xhtml-framework.mod;

<!-- Basic Text Module (Required) ..... -->
<!ENTITY % xhtml-text.mod
PUBLIC "-//W3C//ELEMENTS XHTML Basic Text 1.0//EN"
"http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-text-1.mod" >
%xhtml-text.mod;

<!-- Hypertext Module (required) ..... -->
<!ENTITY % xhtml-hypertext.mod
PUBLIC "-//W3C//ELEMENTS XHTML Hypertext 1.0//EN"
"http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-hypertext-1.mod" >
%xhtml-hypertext.mod;

```

```

<!-- Lists Module (required) ..... -->
<!ENTITY % xhtml-list.mod
    PUBLIC "-//W3C//ELEMENTS XHTML Lists 1.0//EN"
        "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-list-1.mod" >
%xhtml-list.mod;

<!-- My Elements Module ..... -->
<!ENTITY % MyML-elements.mod
    SYSTEM "myml-elements-1.mod" >
%MyML-elements.mod;

<!-- XHTML Images module ..... -->
<!ENTITY % xhtml-image.mod
    PUBLIC "-//W3C//ELEMENTS XHTML Images 1.0//EN"
        "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-image-1.mod" >
%xhtml-image.mod;

<!-- Document Metainformation Module ..... -->
<!ENTITY % xhtml-meta.mod
    PUBLIC "-//W3C//ELEMENTS XHTML Metainformation 1.0//EN"
        "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-meta-1.mod" >
%xhtml-meta.mod;

<!-- Document Structure Module (required) ..... -->
<!ENTITY % xhtml-struct.mod
    PUBLIC "-//W3C//ELEMENTS XHTML Document Structure 1.0//EN"
        "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-struct-1.mod" >
%xhtml-struct.mod;

```

E.5. Using the new DTD

Once a new DTD has been developed, it can be used in any document. Using the DTD is as simple as just referencing it in the DOCTYPE declaration of a document:

```

<!DOCTYPE html SYSTEM "myml-1_0.dtd" >
<html xmlns="http://www.w3.org/1999/xhtml" >
<head>
<title>An example using defaults</title>
</head>
<body>
<p>This is content in the XHTML namespace</p>
<myelement>
    This is content in the SimpleML namespace.
    <myotherelement />
</myelement>
<p></p>
</body>
</html>

```

The document can also use the elements outside of the XHTML namespace by prefixing them:

```
<!DOCTYPE html SYSTEM "myml-1_0.dtd" [  
  <!ENTITY % MyML.prefixed "INCLUDE" >  
]>  
<html xmlns="http://www.w3.org/1999/xhtml" >  
<head>  
<title>An example using defaults</title>  
</head>  
<body>  
<p>This is content in the XHTML namespace</p>  
<myml:myelement>  
  This is content in the myml namespace.  
  <myml:myotherelement />  
</myml:myelement>  
<p></p>  
</body>  
</html>
```

F. XHTML DTD Module Implementations

This appendix is *normative*.

This appendix will contain implementations of the modules defined in XHTML Abstract Modules [p.29] via XML DTDs. These module implementations can be used by XHTML Family Document Types.

F.1. XHTML Character Entities

XHTML DTDs make available a standard collection of named character entities. Those entities are defined in this section.

F.1.1. XHTML Latin 1 Character Entities

```
<!-- ..... -->
<!-- XML-compatible ISO Latin 1 Character Entity Set for XHTML ..... -->
<!-- file: xhtml-lat1.ent

Typical invocation:

<!ENTITY % xhtml-lat1
PUBLIC "-//W3C//ENTITIES Latin 1 for XHTML//EN"
"xhtml-lat1.ent" >
%xhtml-lat1;

This DTD module is identified by the PUBLIC and SYSTEM identifiers:

PUBLIC "-//W3C//ENTITIES Latin 1 for XHTML//EN"
SYSTEM "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-lat1.ent"

Revision: $Id: xhtml-lat1.ent,v 4.1 2001/04/10 09:34:14 altheim Exp $ SMI

```

F.2. XHTML Modular Framework

In order to take advantage of the XHTML DTD Modules, DTD authors need to define the content model for their DTD. XHTML provides a variety of tools to ease this effort. They are defined in a set of support modules, instantiated by a main Framework module:

```

<!-- ..... -->
<!-- XHTML Modular Framework Module ..... -->
<!-- file: xhtml-framework-1.mod

This is XHTML, a reformulation of HTML as a modular XML application.
Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights Reserved.
Revision: $Id: xhtml-framework-1.mod,v 4.0 2001/04/02 22:42:49 altheim Exp $ SMI

This DTD module is identified by the PUBLIC and SYSTEM identifiers:

PUBLIC "-//W3C//ENTITIES XHTML Modular Framework 1.0//EN"
SYSTEM "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-framework-1.mod"

Revisions:
(none)
..... -->

<!-- Modular Framework

This required module instantiates the modules needed
to support the XHTML modularization model, including:

+ notations
+ datatypes
+ namespace-qualified names
+ common attributes
+ document model
+ character entities

The Intrinsic Events module is ignored by default but
occurs in this module because it must be instantiated
prior to Attributes but after Datatypes.

-->

<!ENTITY % xhtml-arch.module "IGNORE" >
<![%xhtml-arch.module;[
<!ENTITY % xhtml-arch.mod

```

```

    PUBLIC "-//W3C//ELEMENTS XHTML Base Architecture 1.0//EN"

F.2.5. XHTML Qualified Names

```

<!-- ..... -->
<!-- XHTML QName Module ..... -->
<!-- file: xhtml-qname-1.mod

This is XHTML, a reformulation of HTML as a modular XML application.
Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights Reserved.
Revision: $Id: xhtml-qname-1.mod,v 4.0 2001/04/02 22:42:49 altheim Exp $ SMI

This DTD module is identified by the PUBLIC and SYSTEM identifiers:

    PUBLIC "-//W3C//ENTITIES XHTML Qualified Names 1.0//EN"
    SYSTEM "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-qname-1.mod"

Revisions:
#2000-10-22: added qname declarations for ruby elements
..... -->

<!-- XHTML QName (Qualified Name) Module

This module is contained in two parts, labeled Section 'A' and 'B':

Section A declares parameter entities to support namespace-
qualified names, namespace declarations, and name prefixing
for XHTML and extensions.

Section B declares parameter entities used to provide
namespace-qualified names for all XHTML element types:

    %applet.qname;    the xmlns-qualified name for <applet>
    %base.qname;     the xmlns-qualified name for <base>
    ...

XHTML extensions would create a module similar to this one.
Included in the XHTML distribution is a template module
('template-qname-1.mod') suitable for this purpose.
-->

<!-- Section A: XHTML XML Namespace Framework :::::::::::::::::::: -->

<!-- 1. Declare a %XHTML.prefixed; conditional section keyword, used
to activate namespace prefixing. The default value should
inherit '%NS.prefixed;' from the DTD driver, so that unless
overridden, the default behaviour follows the overall DTD
prefixing scheme.
-->

```

```

<!ENTITY % NS.prefixed "IGNORE" >
<!ENTITY % XHTML.prefixed "%NS.prefixed;" >

<!-- 2. Declare a parameter entity (eg., %XHTML.xmlns;) containing
      the URI reference used to identify the XHTML namespace:
-->
<!ENTITY % XHTML.xmlns "http://www.w3.org/1999/xhtml" >

<!-- 3. Declare parameter entities (eg., %XHTML.prefix;) containing
      the default namespace prefix string(s) to use when prefixing
      is enabled. This may be overridden in the DTD driver or the
      internal subset of an document instance. If no default prefix
      is desired, this may be declared as an empty string.

      NOTE: As specified in [XMLNAMES], the namespace prefix serves
      as a proxy for the URI reference, and is not in itself significant.
-->
<!ENTITY % XHTML.prefix "" >

<!-- 4. Declare parameter entities (eg., %XHTML.pfx;) containing the
      colonized prefix(es) (eg., '%XHTML.prefix;:') used when
      prefixing is active, an empty string when it is not.
-->
<![%XHTML.prefixed;[
<!ENTITY % XHTML.pfx "%XHTML.prefix;:" >
]]>
<!ENTITY % XHTML.pfx "" >

<!-- declare qualified name extensions here ..... -->
<!ENTITY % xhtml-qname-extra.mod "" >
%xhtml-qname-extra.mod;

<!-- 5. The parameter entity %XHTML.xmlns.extra.attrib; may be
      redeclared to contain any non-XHTML namespace declaration
      attributes for namespaces embedded in XHTML. The default
      is an empty string. XLink should be included here if used
      in the DTD.
-->
<!ENTITY % XHTML.xmlns.extra.attrib "" >

<!-- The remainder of Section A is only followed in XHTML, not extensions. -->

<!-- Declare a parameter entity %NS.decl.attrib; containing
      all XML Namespace declarations used in the DTD, plus the
      xmlns declaration for XHTML, its form dependent on whether
      prefixing is active.
-->
<![%XHTML.prefixed;[

<!-- Basic Tables

    table, caption, tr, th, td

This table module declares elements and attributes defining
a table model based fundamentally on features found in the
widely-deployed HTML 3.2 table model. While this module
mimics the content model and table attributes of HTML 3.2
tables, the element types declared herein also includes all
HTML 4 common and most of the HTML 4 table attributes.
-->

F.3.21. Legacy

```

<!-- ..... -->
<!-- XHTML Legacy Markup Module ..... -->
<!-- file: xhtml-legacy-1.mod

This is an extension of XHTML, a reformulation of HTML as a modular XML application.
Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights Reserved.
Revision: $Id: xhtml-legacy-1.mod,v 4.1 2001/04/10 09:42:30 altheim Exp $ SMI

This DTD module is identified by the PUBLIC and SYSTEM identifiers:

    PUBLIC "-//W3C//ELEMENTS XHTML Legacy Markup 1.0//EN"
    SYSTEM "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-legacy-1.mod"

Revisions:
(none)
..... -->

<!-- HTML Legacy Markup

    font, basefont, center, s, strike, u, dir, menu, isindex

    (plus additional datatypes and attributes)

This optional module declares additional markup for simple
presentation-related markup based on features found in the
HTML 4 Transitional and Frameset DTDs. This relies on
inclusion of the Legacy Redeclarations module. This module
also declares the frames, inline frames and object modules.

This is to allow XHTML 1.1 documents to be transformed for
display on HTML browsers where CSS support is inconsistent
or unavailable.
-->
<!-- Constructing a Legacy DTD

To construct a DTD driver obtaining a close approximation
of the HTML 4 Transitional and Frameset DTDs, declare the
Legacy Redeclarations module as the pre-framework redeclaration
parameter entity (%xhtml-prefw-redecl.mod;) and INCLUDE its
conditional section:

...
<!ENTITY % xhtml-prefw-redecl.module "INCLUDE" >
<![%xhtml-prefw-redecl.module;[
<!ENTITY % xhtml-prefw-redecl.mod
    PUBLIC "-//W3C//ELEMENTS XHTML Legacy Redeclarations 1.0//EN"
    "xhtml-legacy-redecl-1.mod" >
%xhtml-prefw-redecl.mod;]]>

Such a DTD should be named with a variant FPI and redeclare
the value of the %XHTML.version; parameter entity to that FPI:

    "-//Your Name Here//DTD XHTML Legacy 1.1//EN"

IMPORTANT: see also the notes included in the Legacy Redeclarations
Module for information on how to construct a DTD using this module.
-->

```

```

F.4. XHTML DTD Support Modules

The modules in this section are elements of the XHTML DTD implementation that, while hidden from casual users, are important to understand when creating derivative markup languages using the Modularization architecture.

F.4.1. Block Phrasal

```

<!-- ..... -->
<!-- XHTML Block Phrasal Module ..... -->
<!-- file: xhtml-blkphras-1.mod

```

```

This is XHTML, a reformulation of HTML as a modular XML application.
Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights Reserved.
Revision: $Id: xhtml-blkphras-1.mod,v 4.0 2001/04/02 22:42:49 altheim Exp $ SMI

```

```

This DTD module is identified by the PUBLIC and SYSTEM identifiers:

```

```

PUBLIC "-//W3C//ELEMENTS XHTML Block Phrasal 1.0//EN"

```

```

SYSTEM "http://www.w3.org/TR/xhtml-modularization/DTD/xhtml-blkphras-1.mod"

```

```
<!-- Legacy Redeclarations
```

```
This optional module replaces the Modular Framework module, interspersing
redeclarations of various parameter entities to allow for inclusions of
Transitional markup in the XHTML 1.1 document model. This instantiates
the modules needed to support the XHTML modularization model, including:
```

```
+ notations
+ datatypes
+ namespace-qualified names
+ common attributes
+ document model
+ character entities
```

```
By default, the Object module is included, with Frames and IFrames ignored.
```

```
The Intrinsic Events module is ignored by default but
occurs in this module because it must be instantiated
prior to Attributes but after Datatypes.
```

H. Design Goals

This appendix is *informative*.

In this appendix, design goals are identified with a label "Gn", and requirements are identified with a label "Rn.n". There are four major design goals for the modularization framework for XHTML:

- [G1] To group semantically related parts of XHTML together.
- [G2] Using DTD technology, to support the creation of related languages (subsets, supersets) for specific purposes (small devices, special-purpose devices), while guaranteeing commonality of the overlapping parts.
- [G3] To facilitate future development by allowing parts of the language to be replaced by improved modules (for instance, forms) without disturbing the rest of the language.
- [G4] To encourage and facilitate the reuse of modules in other languages.

H.1. Requirements

The design goals listed in the previous section lead to a large number of requirements for the modularization framework. These requirements, summarized in this section, can be further classified according to the major features of the framework to be described.

H.1.1. Granularity

Collectively the requirements in this section express the desire that the modules defined within the framework hit the right level of granularity:

- [R1.1] Abstract modules should promote and maintain content portability.
- [R1.2] Abstract modules should promote platform profile standardization.
- [R1.3] Abstract modules should be large enough to promote interoperability.
- [R1.4] Abstract modules should be small enough to avoid the need for subsets.
- [R1.5] Abstract modules should collect elements with similar or related semantics.
- [R1.6] Abstract modules should separate elements with dissimilar or unrelated semantics.
- [R1.7] Modules should be small enough to allow single element document type modules.

H.1.2. Composibility

The composibility requirements listed here are intended to ensure that the modularization framework be able to express the right set of target modules required by the communities that will be served by the framework:

- [R2.1] The module framework should allow construction of abstract modules for XHTML 1.0.
- [R2.2] The module framework should allow construction of abstract modules that closely approximate HTML 4.
- [R2.3] The module framework should allow construction of abstract modules for other W3C

Recommendations.

- [R2.4] The module framework should allow construction of abstract modules for other XML document types.
- [R2.5] The module framework should allow construction of abstract modules for a wide range of platform profiles.

H.1.3. Ease of Use

The modularization framework will only receive widespread adoption if it describes mechanisms that make it easy for our target audience to use the framework:

- [R3.1] The module framework should make it easy for document type designers to subset and extend XHTML abstract modules.
- [R3.2] The module framework should make it easy for document type designers to create abstract modules for other XML document types.
- [R3.3] The module framework should make it easy for document authors to validate elements from different abstract modules.

H.1.4. Compatibility

The intent of this document is that the modularization framework described here should work well with the XML and other standards being developed by the W3C Working Groups:

- [R4.1] The module framework should strictly conform to the XML 1.0 Recommendation.
- [R4.2] The module framework should be compatible with the XML Linking Language (XLink) [XLINK] [p.171] specification.
- [R4.3] The module framework should be compatible with the Associating Style Sheets with XML documents [XMLSTYLE] [p.171] specification.
- [R4.4] The module framework should be able to adopt new W3C Recommendations where appropriate.
- [R4.5] The module framework should not depend on W3C work in progress.
- [R4.6] The module framework should not depend on work done outside W3C.

H.1.5. Conformance

The effectiveness of the framework will also be measured by how easy it is to test the behavior of modules developed according to the framework, and to test the documents that employ those modules for validation:

- [R5.1] It should be possible to validate documents constructed using elements and attributes from abstract modules.
- [R5.2] It should be possible to explicitly describe the behavior of elements and attributes from abstract modules.
- [R5.3] It should be possible to verify the behavior of elements and attributes from abstract modules.
- [R5.4] It should be possible to verify a hybrid document type as an XHTML document type.

- [R5.5] Modules defined in accordance with the methods in this document shall not duplicate the names of elements or parameter entities defined in XHTML modules.
